

# Threats & Strategies in Critical Care Nursing

Frank Durso  
*Georgia Tech*

The Medical Center  
of Central Georgia

# Overview

- Where I'm coming from
- Threat-Strategy Interview
- PICU Threats
- PICU Strategies
- A threatening threat

# Collaborators

- Sadaf Kazi
- Ashley Ferguson
- Christina Ryan (MSN, RN), CHOA
- Charlene Cunningham (MSN, RN, CCRN), CHOA
- Rebecca Cogburn (CEN, CCRN-P, RN), MCCG

BASIC

APPLIED

Science and  
application are  
bound

together like fruit  
and the tree that  
bears it.

The opposite of a profound truth may well be another profound truth

Without theory, practice is but routine born of habit

Inspired by:

Considerations of use?

No

Yes

Best for fundamental understanding?

Yes

No

Pure basic research

Bohr

Use-inspired basic research

Pasteur

Pure applied research

Edison

Backoff man, I'm a scientist

If I find 10,000 ways something won't work, I haven't failed...every wrong attempt discarded is a step forward

# SA & Comprehension

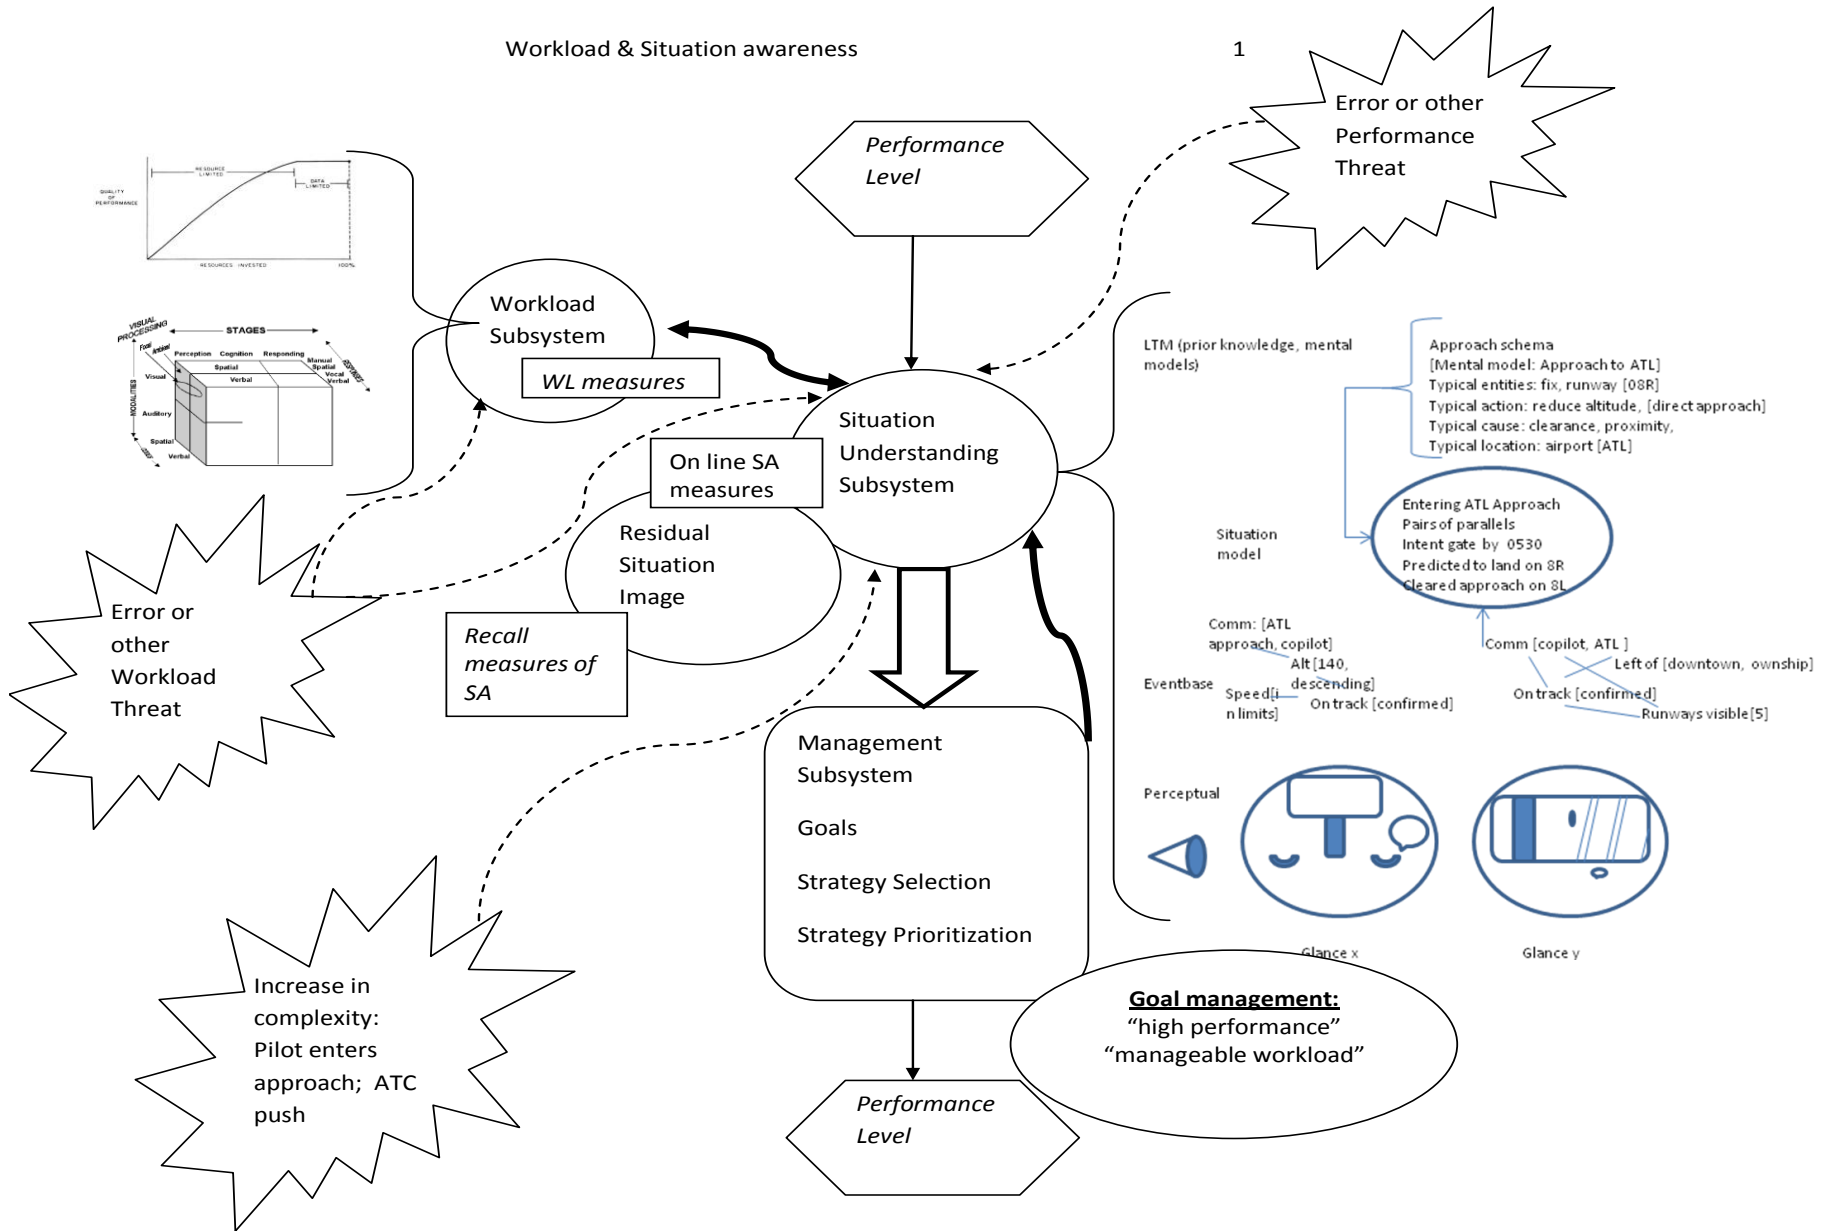

- Cause of motor vehicle accidents & CFITs
- Distinguishes among OJT ratings
- Distinguishes expert pilots and novices
- Distinguishes active involvement from passive monitoring
- Predicts efficiency
- Measuring comprehension predicts ATC errors even after cognitive traits and personality are accounted

# Management is central to behavior in dynamic environments

- Seek information to
- Understand “situation” in order to
- Change strategy and
- Maintain high performance, low workload
  - Helson’s (1949) Par hypothesis

Workload & Situation awareness

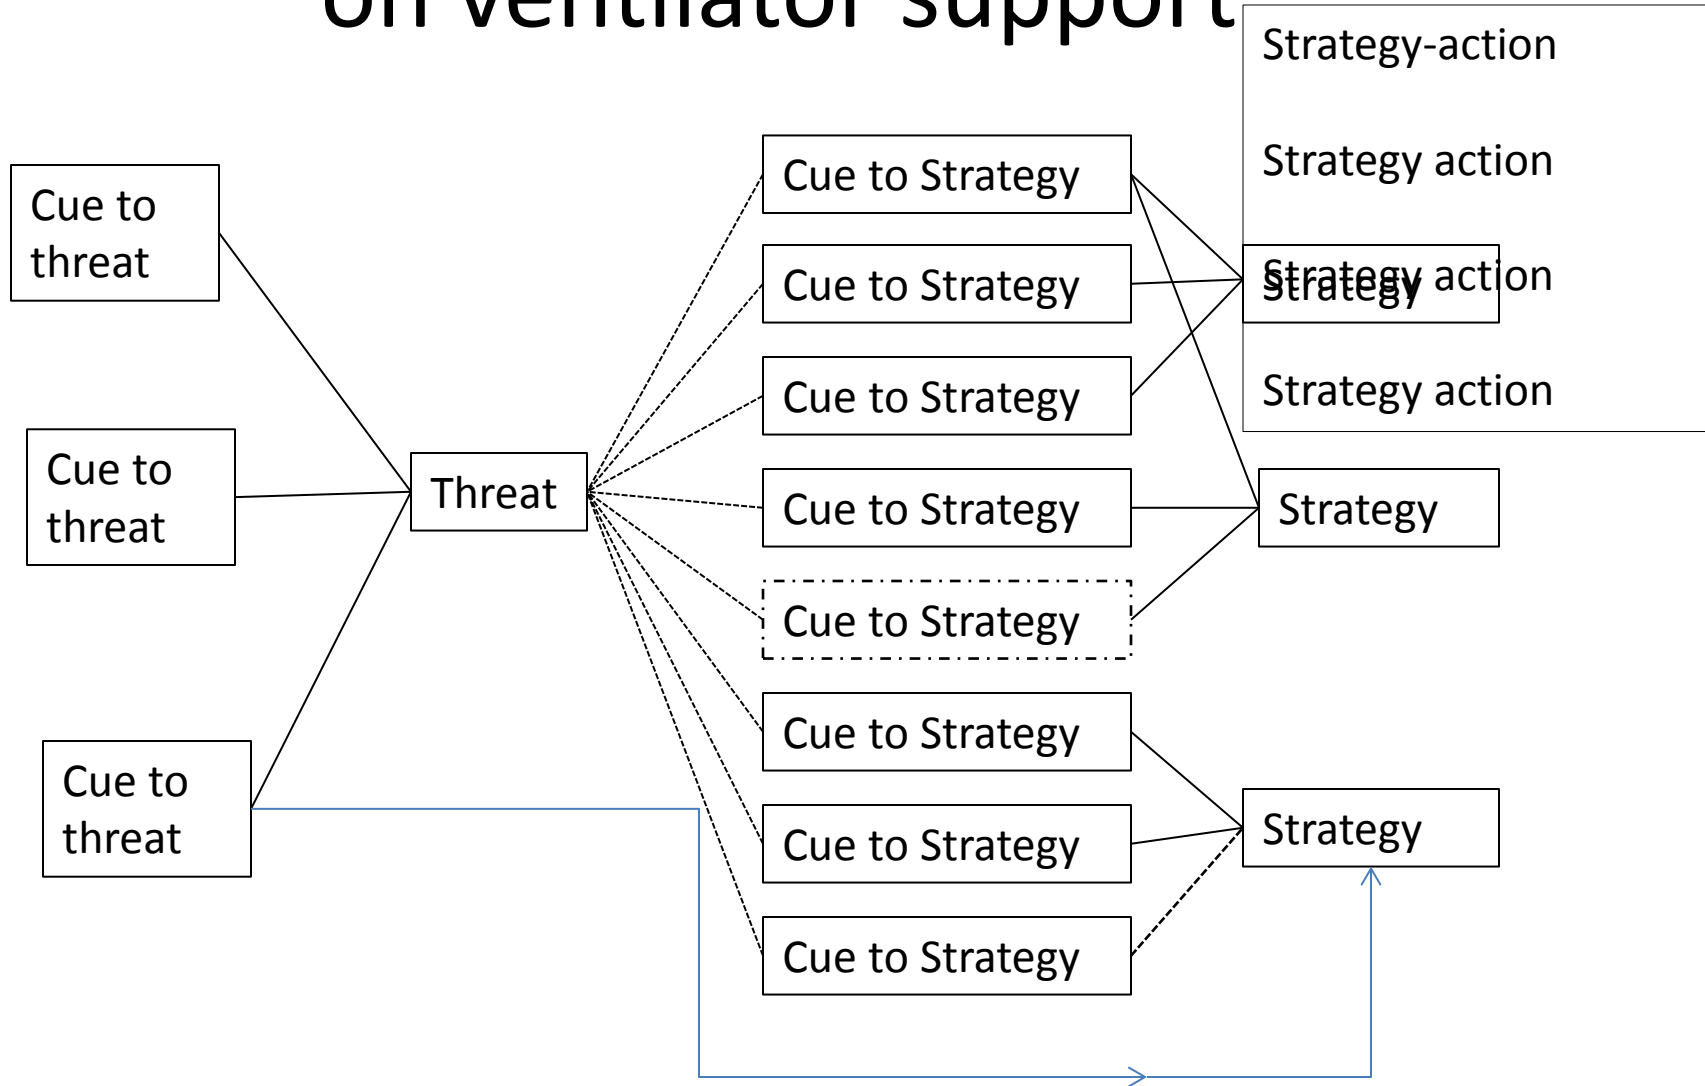

# MANAGING THREATS

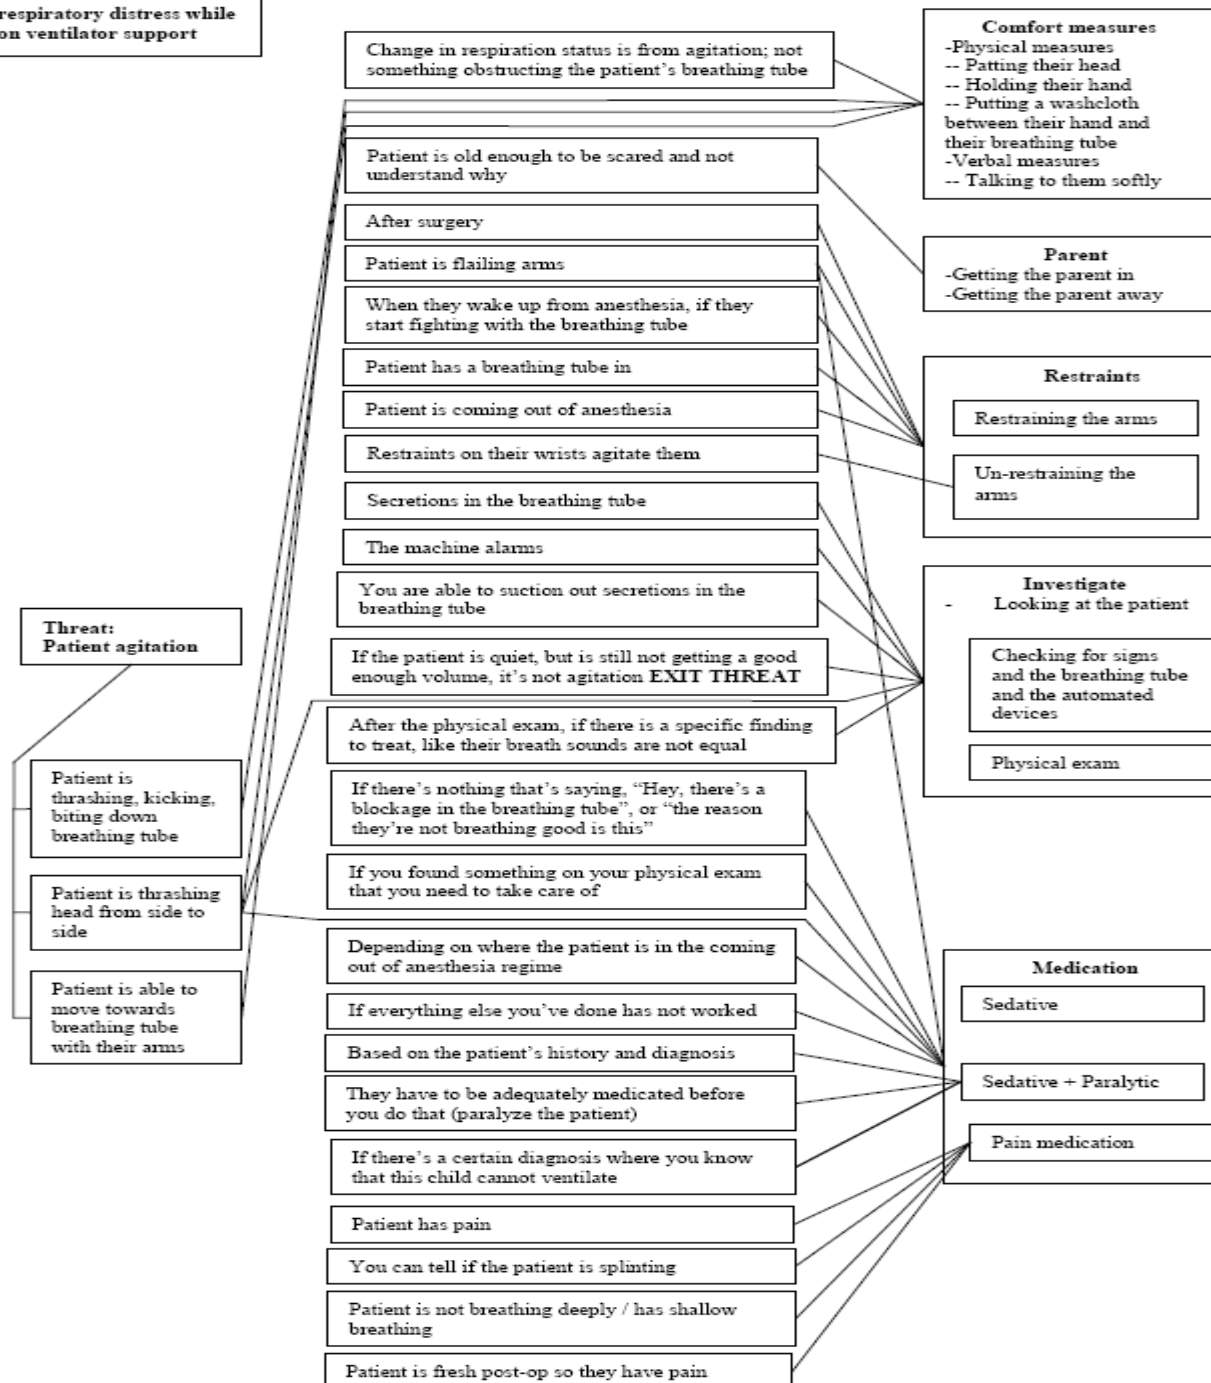

# Threat-Strategy Interview

- Identify threat
- What strategy would you use?
- What cues suggest that strategy?
- Why this strategy and not that?
- Participants
  - Pediatric intensive care nurses
  - Airline pilots [automation]
  - Air traffic controllers
  - Locomotive conductors
  - GT undergraduates [registration]

# Task: Child in respiratory distress while on ventilator support

**Task: Child in respiratory distress while on ventilator support**

**Threat:  
Patient agitation**

Patient is thrashing, kicking, biting down breathing tube

Patient is thrashing head from side to side

Patient is able to move towards breathing tube with their arms

Patient is flailing arms

When they wake up from anesthesia, if they start fighting with the breathing tube

Patient has a breathing tube in

Patient is coming out of anesthesia

Restraints on their wrists agitate them

Secretions in the breathing tube

The machine alarms

You are able to suction out secretions in the breathing tube

If the patient is quiet, but is still not getting a good enough volume, it's not agitation **EXIT THREAT**

After the physical exam, if there is a specific finding to treat, like their breath sounds are not equal

If there's nothing that's saying, "Hey, there's a blockage in the breathing tube", or "the reason they're not breathing good is this"

If you found something on your physical exam that you need to take care of

Depending on where the patient is in the coming out of anesthesia regime

If everything else you've done has not worked

Based on the patient's history and diagnosis

They have to be adequately medicated before you do that (paralyze the patient)

If there's a certain diagnosis where you know that this child cannot ventilate

**Threat:  
Patient agitation**

Patient is thrashing, kicking, biting down breathing tube

Patient is thrashing head from side to side

Patient is able to move towards breathing tube with their arms

Restraints on their wrists agitate them

Secretions in the breathing tube

The machine alarms

You are able to suction out secretions in the breathing tube

If the patient is quiet, but is still not getting a good enough volume, it's not agitation **EXIT THREAT**

After the physical exam, if there is a specific finding to treat, like their breath sounds are not equal

If there's nothing that's saying, "Hey, there's a blockage in the breathing tube", or "the reason they're not breathing good is this"

If you found something on your physical exam that you need to take care of

Depending on where the patient is in the coming out of anesthesia regime

If everything else you've done has not worked

Based on the patient's history and diagnosis

They have to be adequately medicated before you do that (paralyze the patient)

If there's a certain diagnosis where you know that this child cannot ventilate

Patient has pain

You can tell if the patient is splinting

Patient is not breathing deeply / has shallow breathing

Patient is thrashing, kicking, biting down breathing tube

Patient is thrashing head from side to side

Patient is able to move towards breathing tube with their arms

If there's nothing that's saying, "Hey, there's a blockage in the breathing tube", or "the reason they're not breathing good is this"

If you found something on your physical exam that you need to take care of

Depending on where the patient is in the coming out of anesthesia regime

If everything else you've done has not worked

Based on the patient's history and diagnosis

They have to be adequately medicated before you do that (paralyze the patient)

If there's a certain diagnosis where you know that this child cannot ventilate

Patient has pain

You can tell if the patient is splinting

Patient is not breathing deeply / has shallow breathing

Patient is fresh post-op so they have pain

**Task: Child in respiratory distress while on ventilator support**

Change in respiration status is from agitation; not something obstructing the patient's breathing tube

Patient is old enough to be scared and not understand why

After surgery

Patient is flailing arms

When they wake up from anesthesia, if they start fighting with the breathing tube

Patient has a breathing tube in

Patient is coming out of anesthesia

Restraints on their wrists agitate them

Secretions in the breathing tube

# Cues

- Mostly patient oriented
- Mostly perceptual/memorial
- Cues to both threat & strategy
- Exit cues
- Investigative cues (Implicit/Explicit)
- Blocker cues

**THREATS**

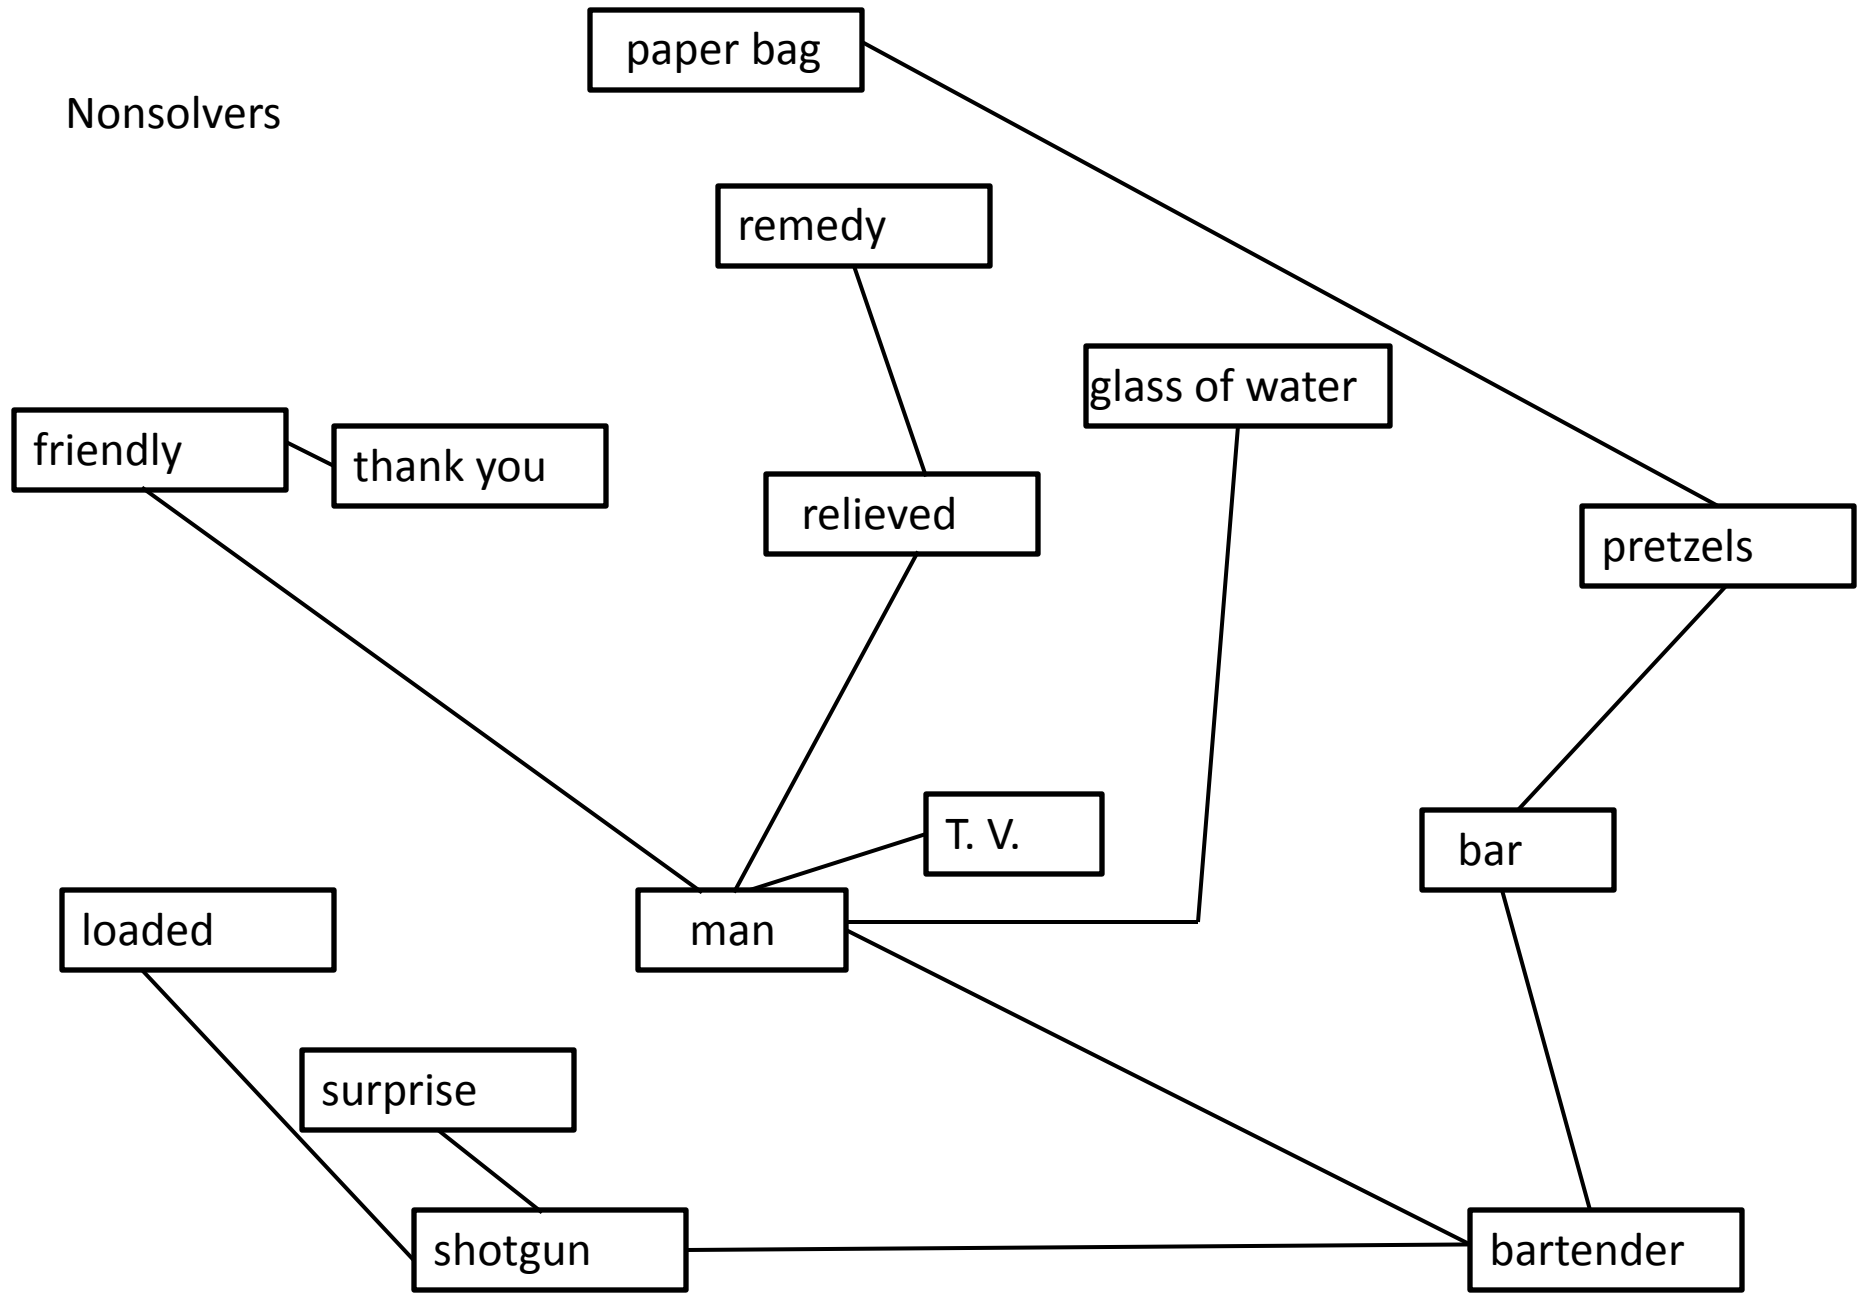

- Do threats change your cognitive landscape?

# Pathfinder Scaling Algorithm

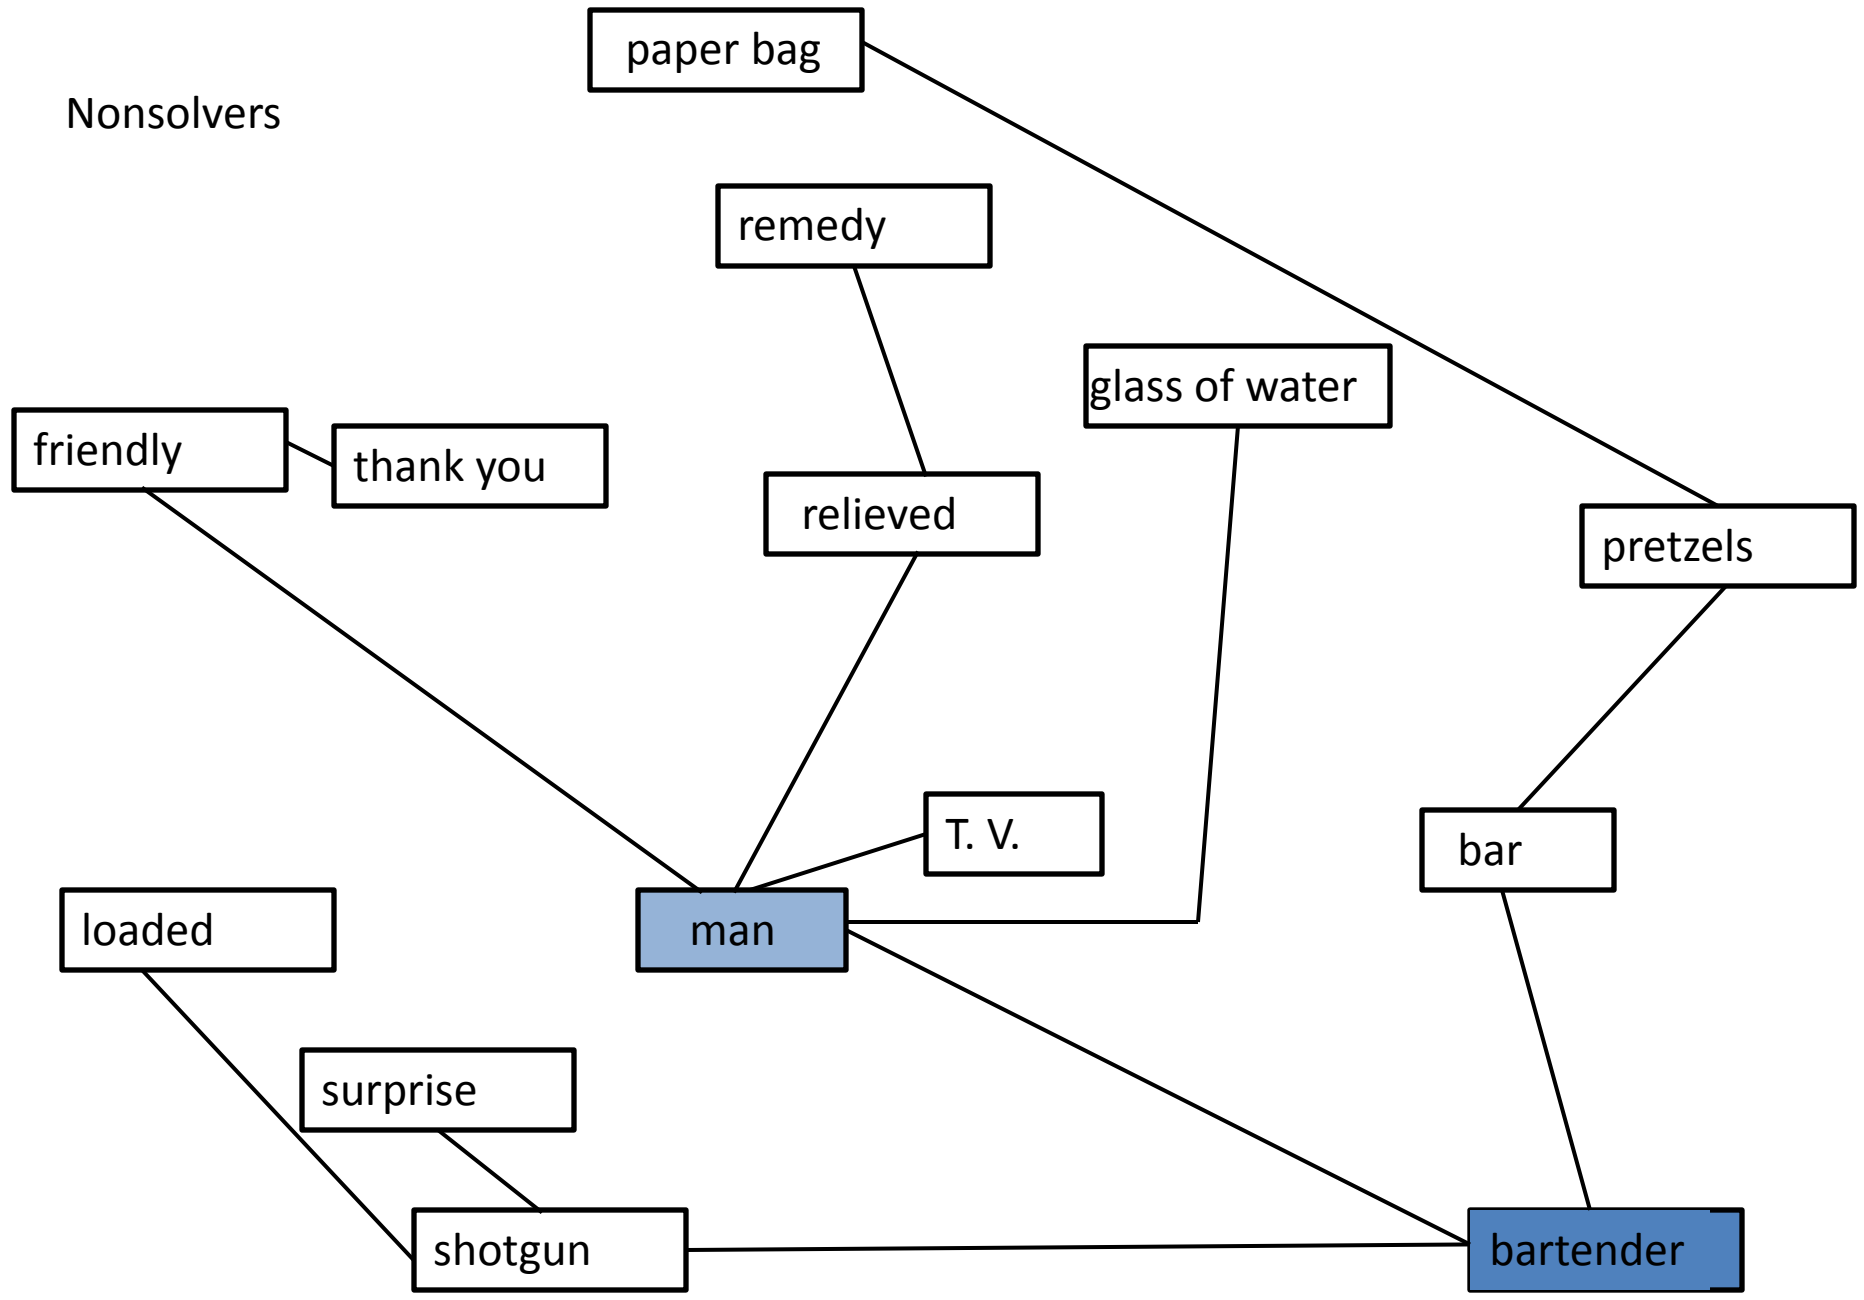

- Man walks into a bar and asks for a glass of water. The bartender points a shotgun at the man. The man says “Thank you,” and walks out.

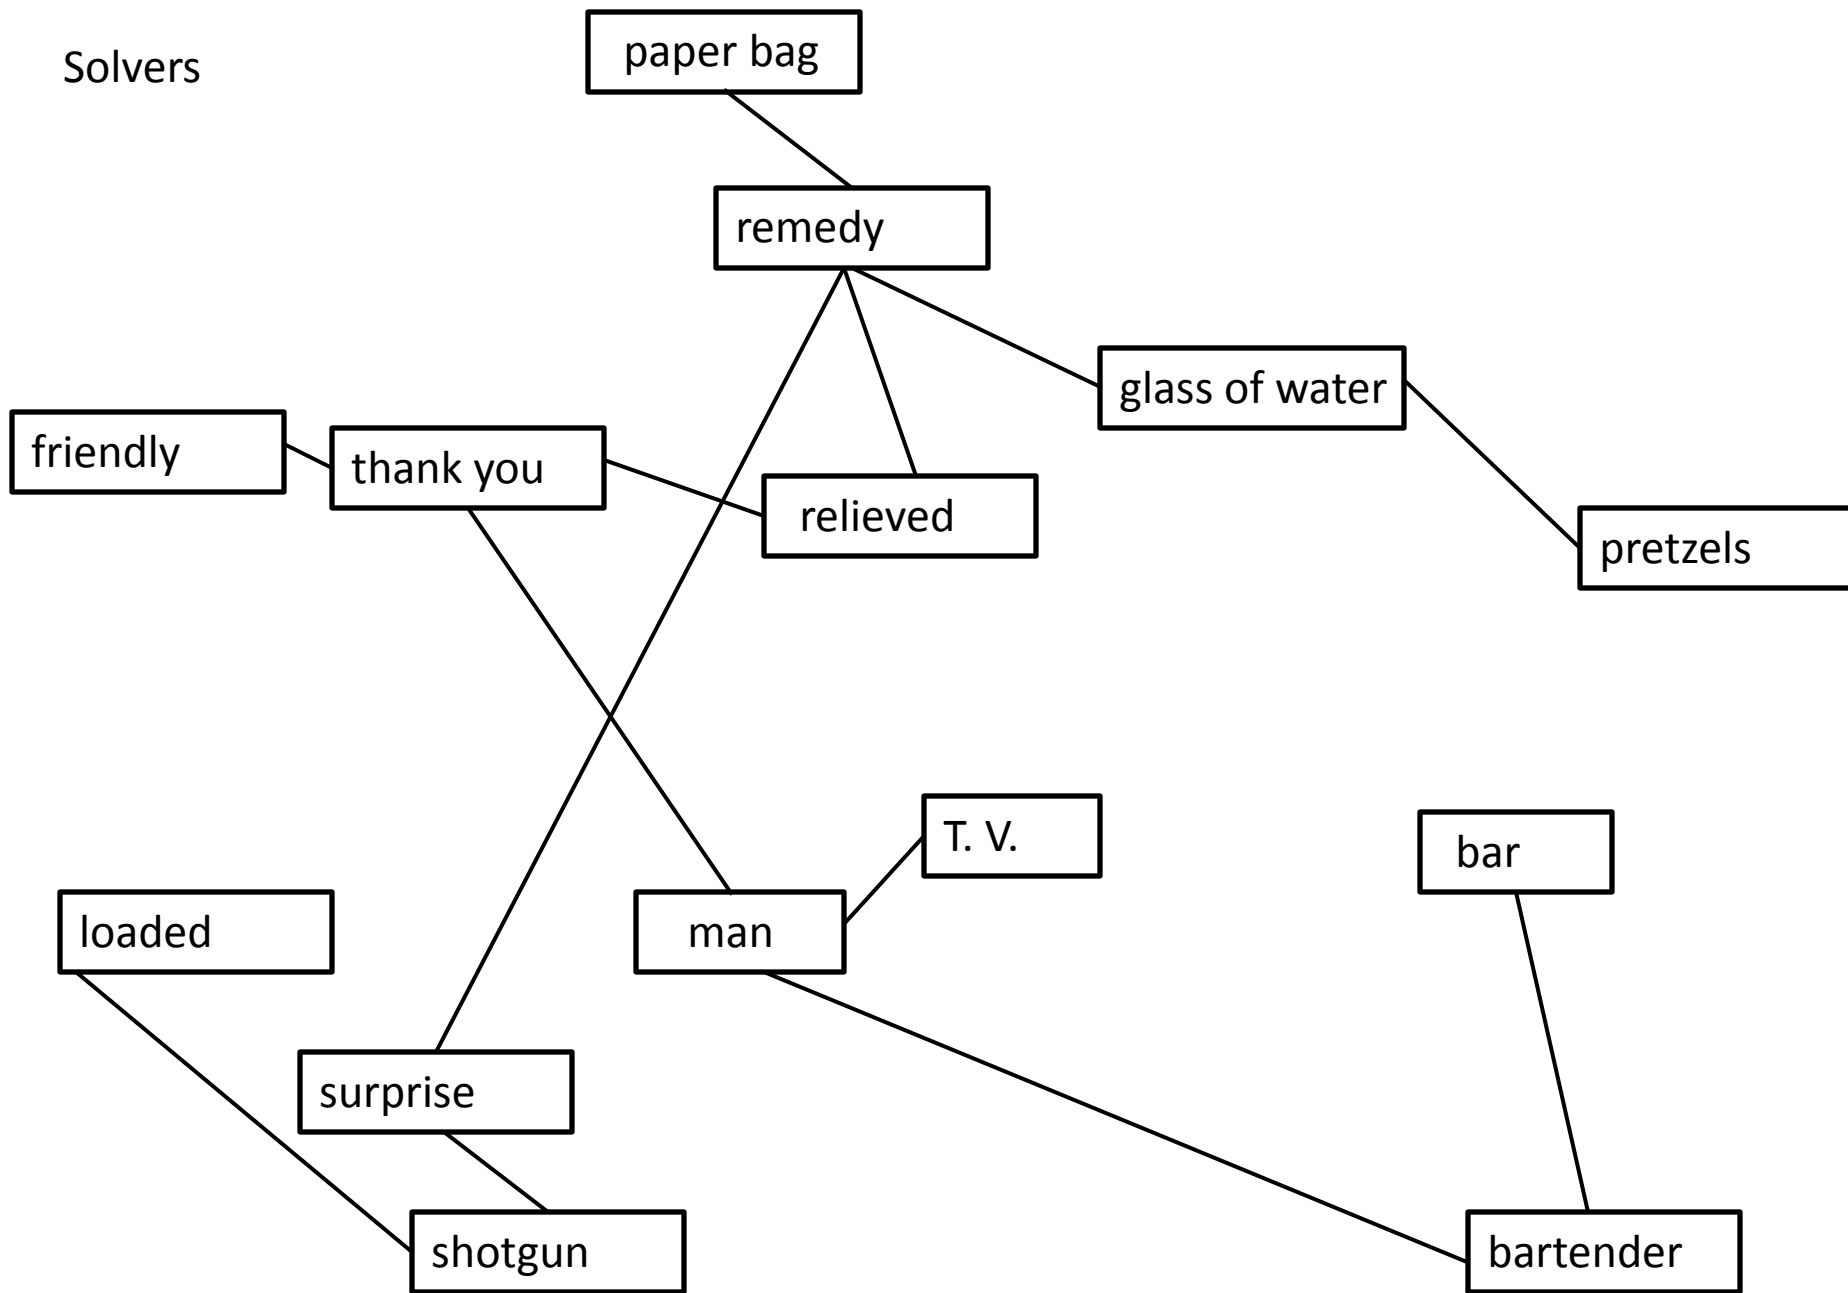

Nonsolvers

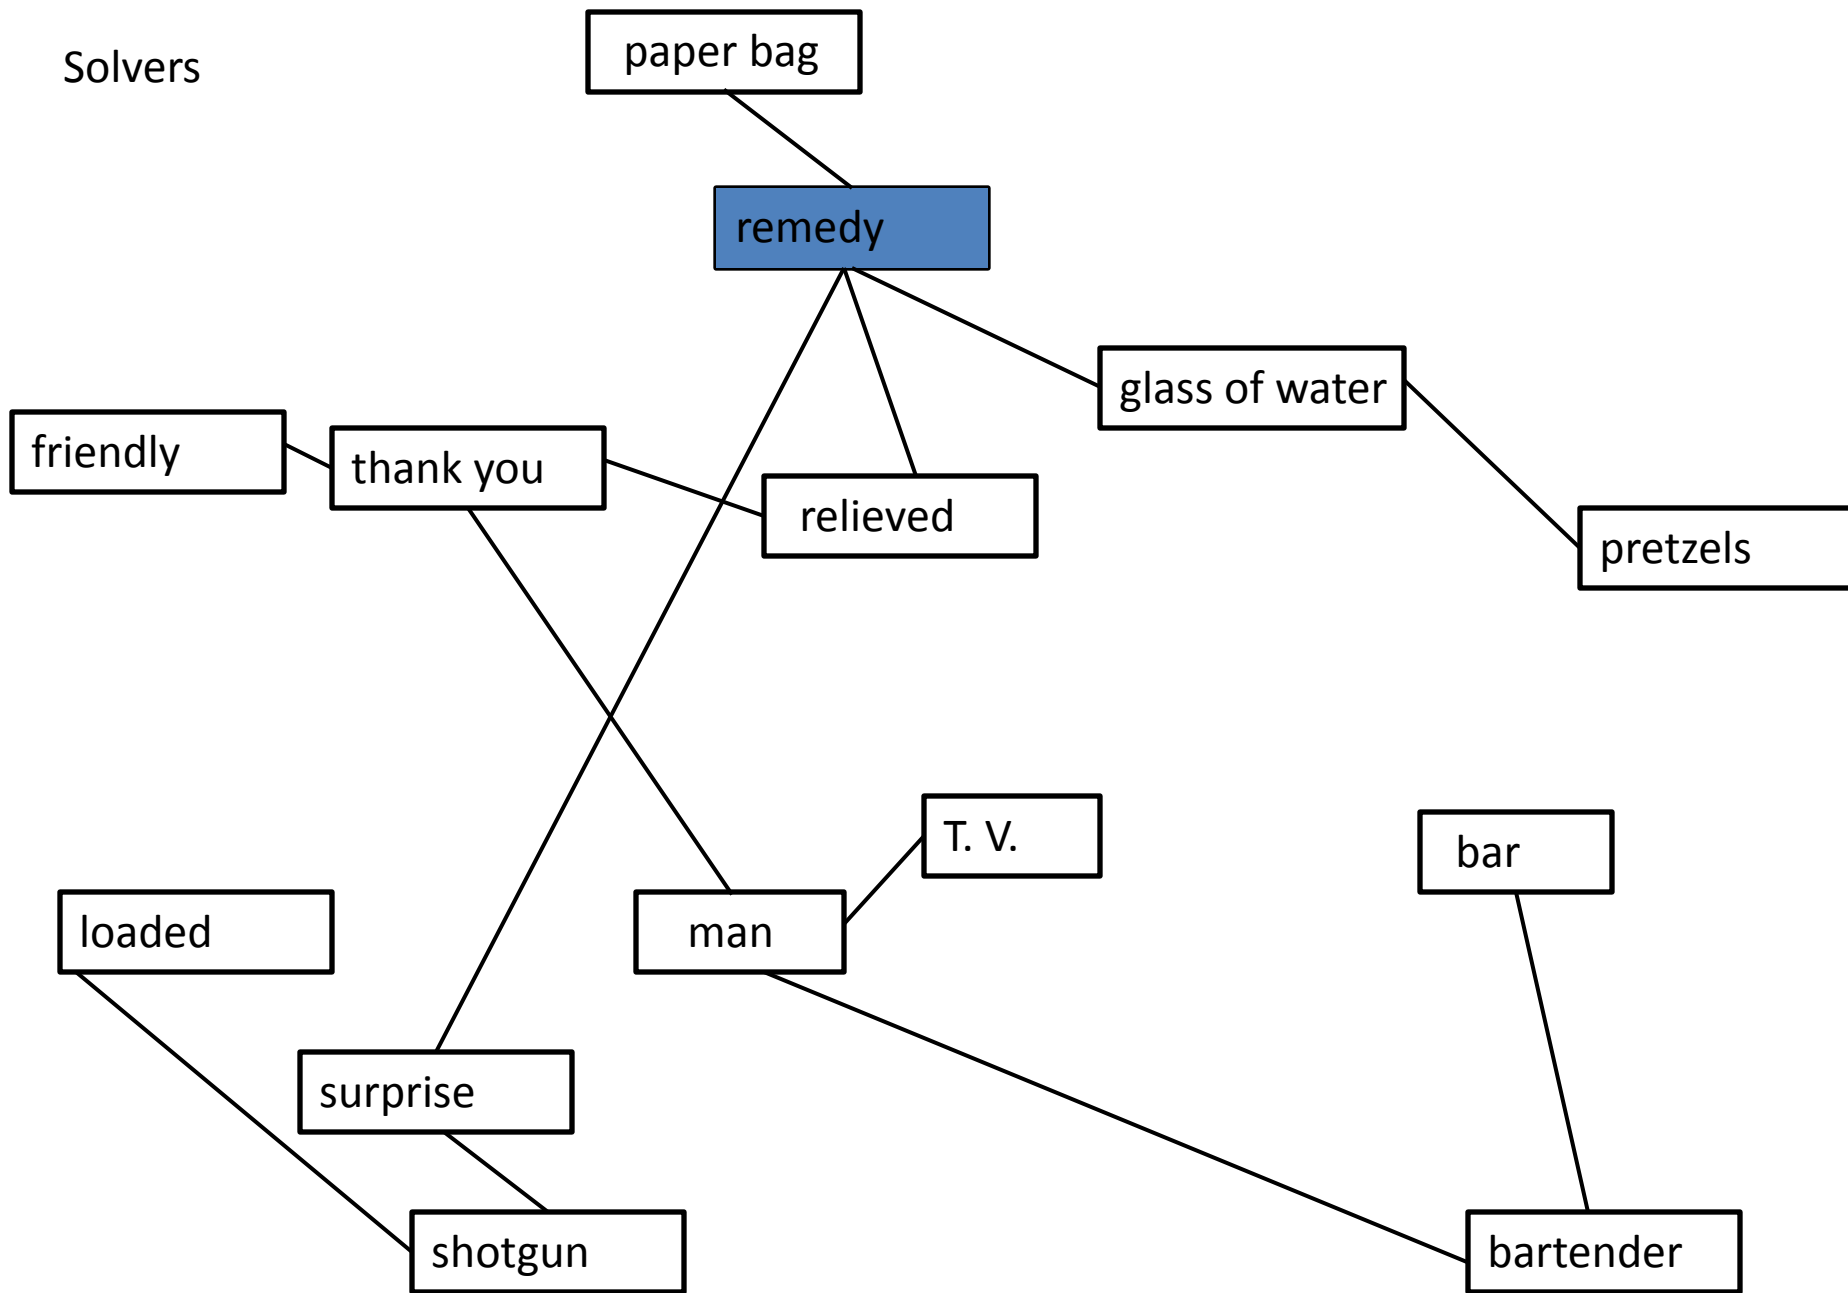

Nonsolvers

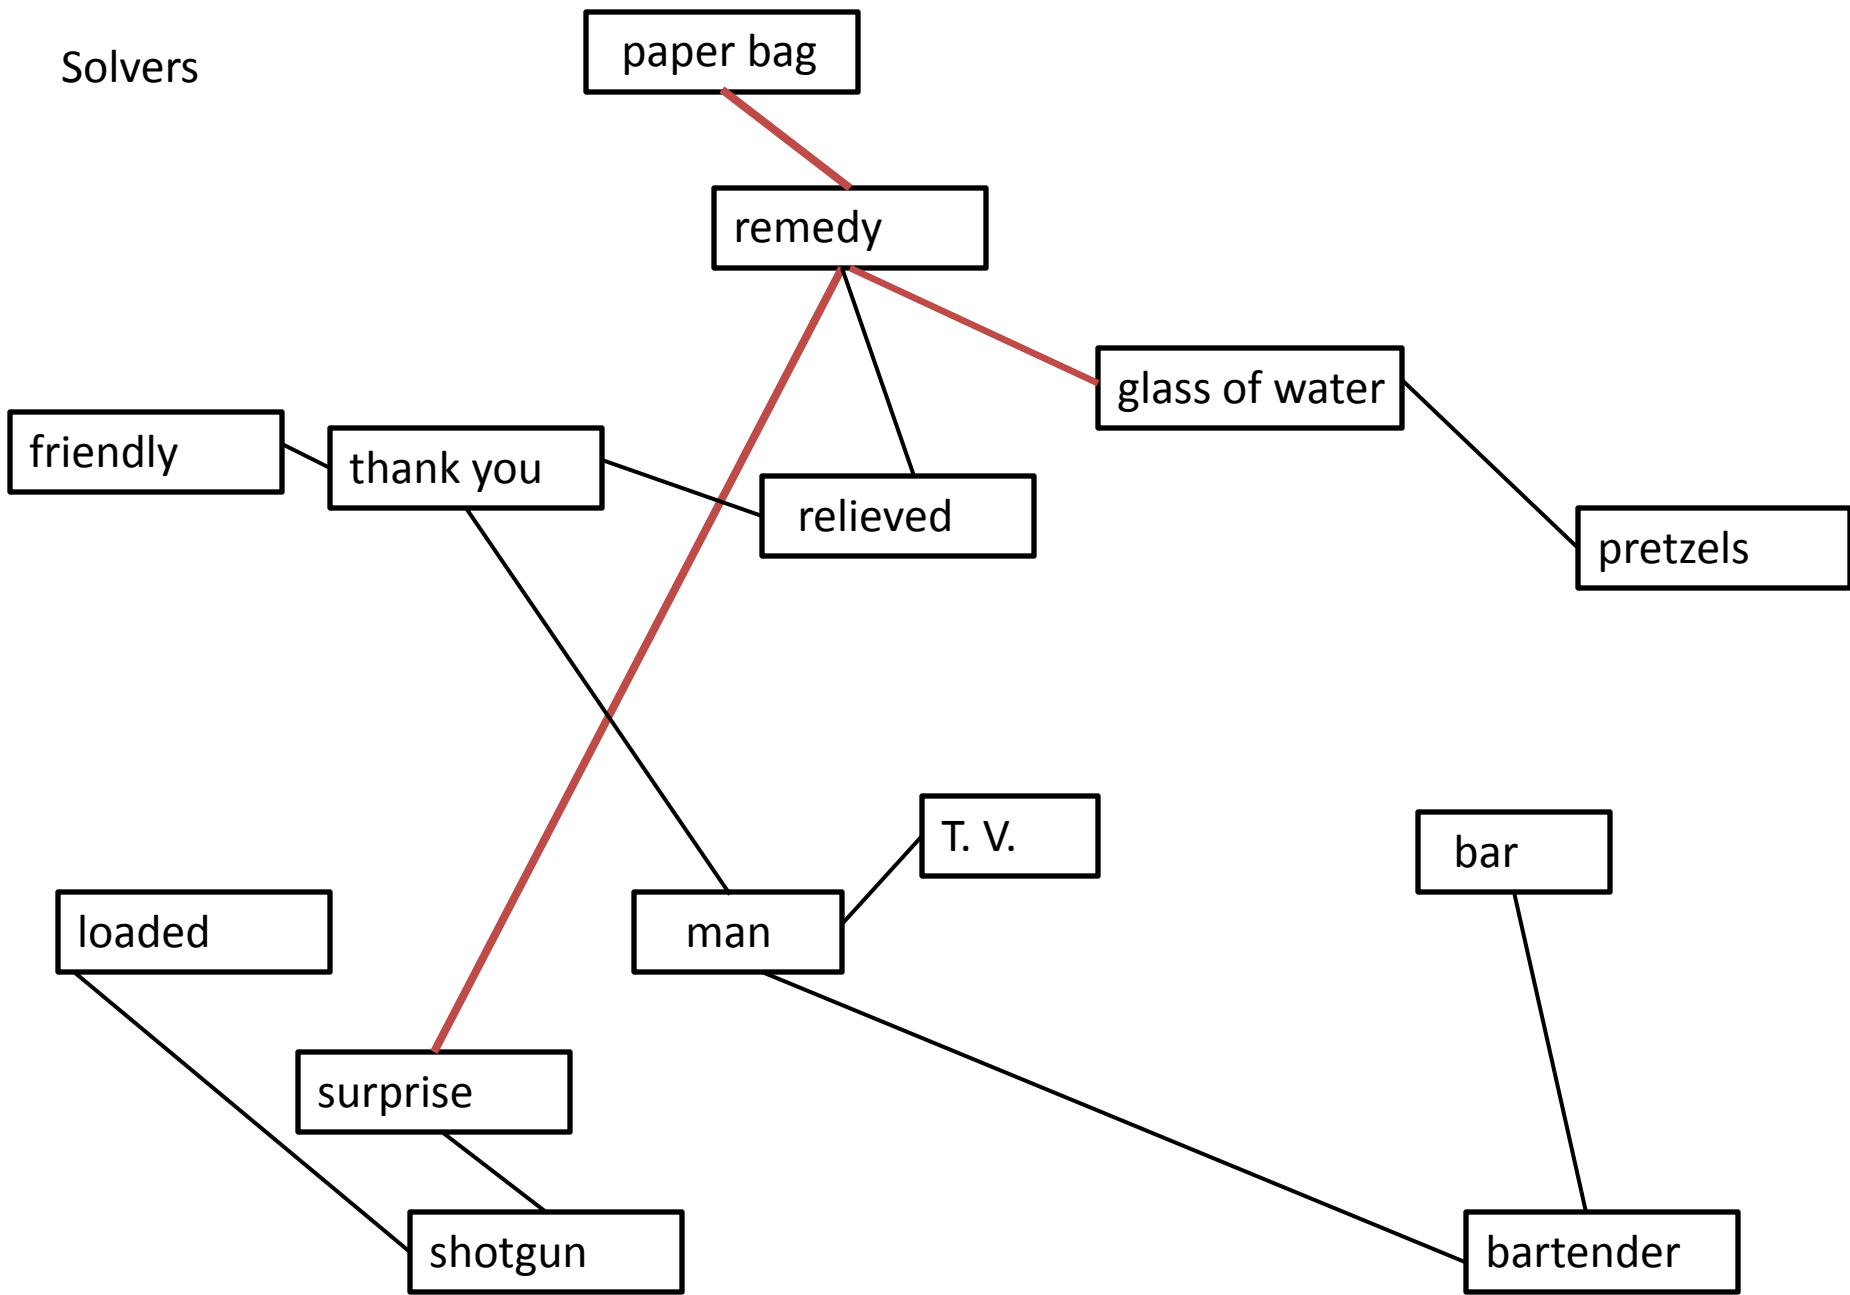

Solvers

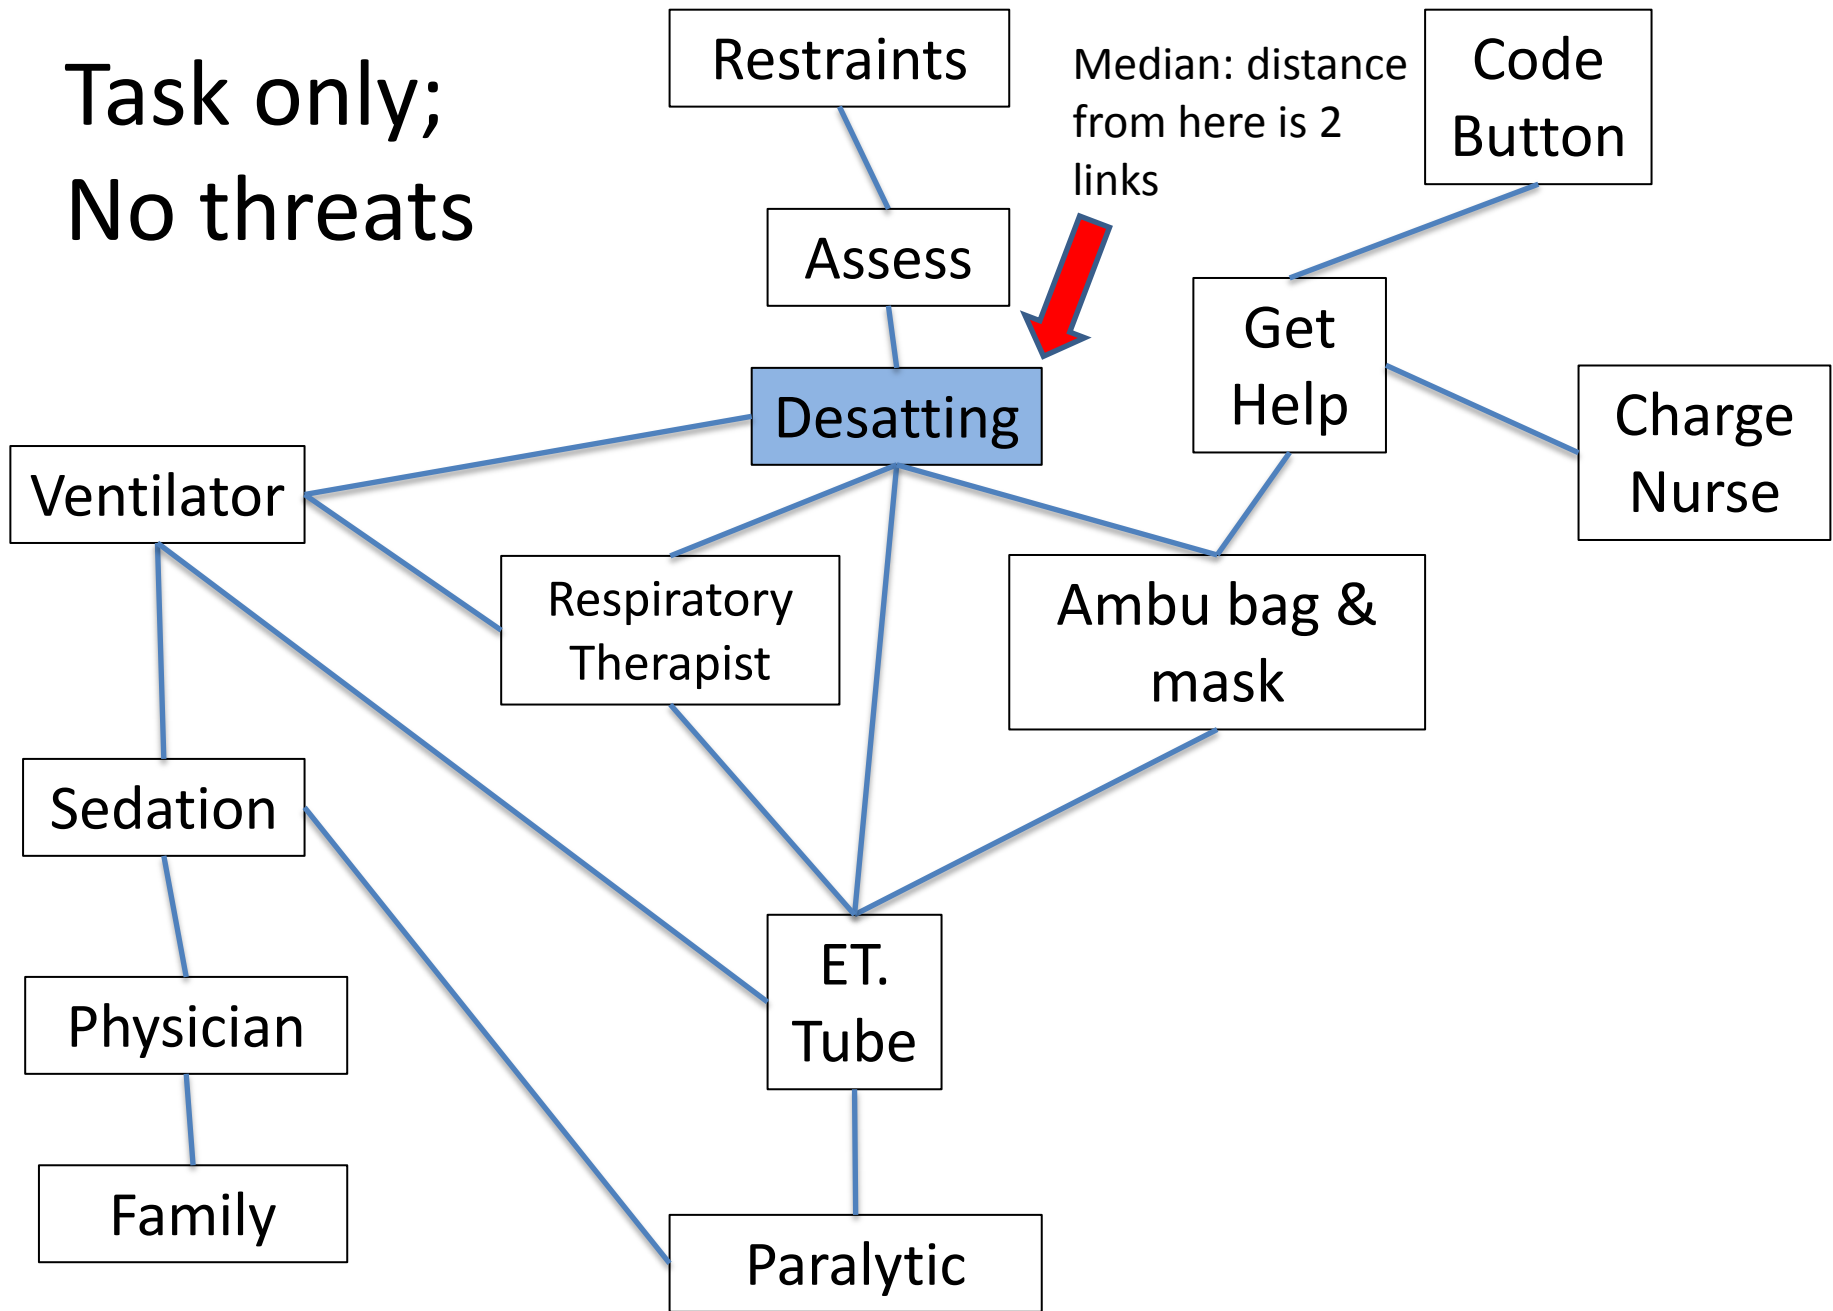

Solvers

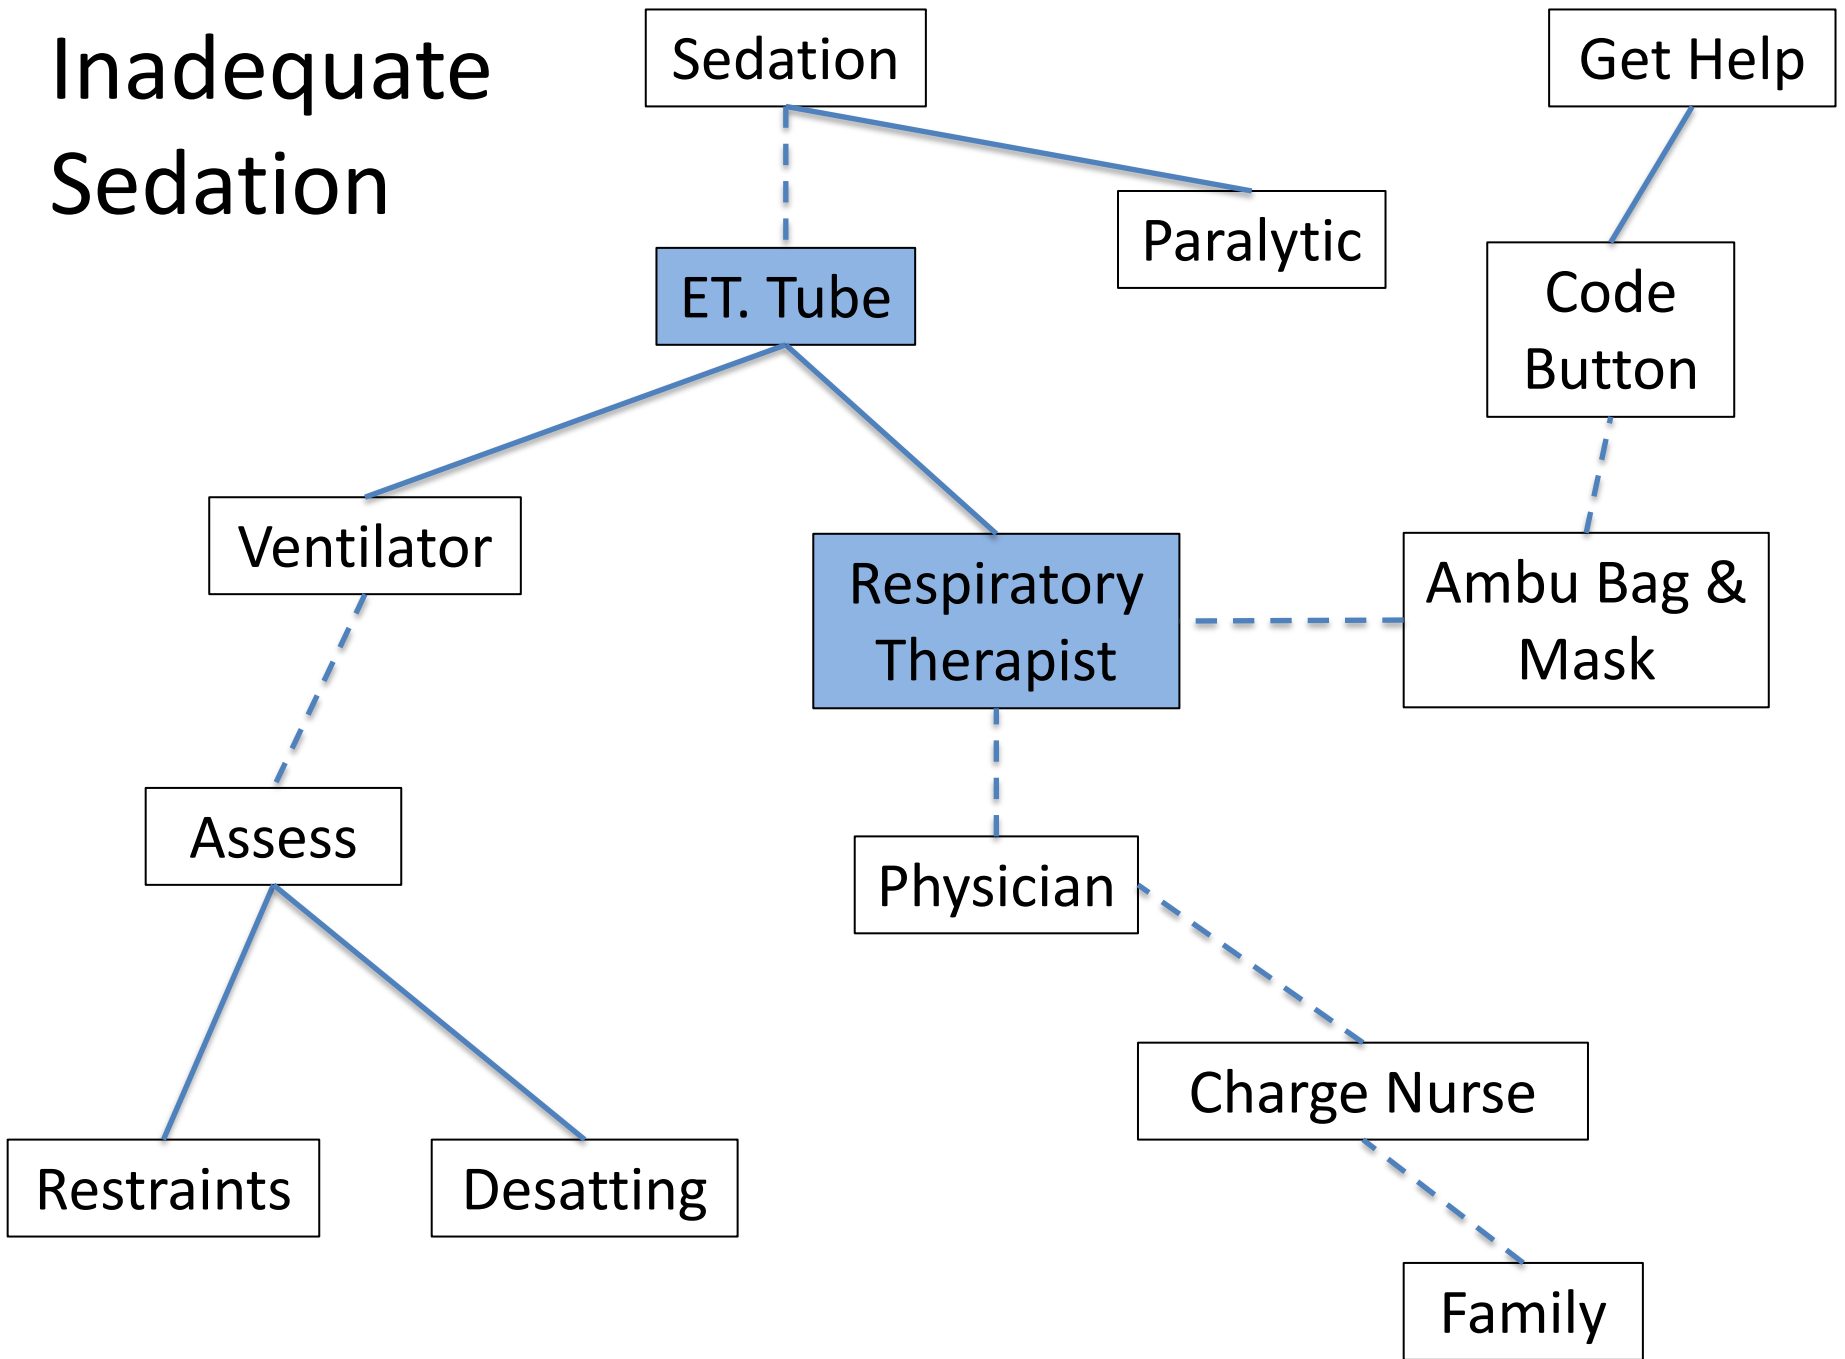

Solvers

Task only;  
No threats

# Inadequate Sedation

- Threats change the cognitive landscape
- They reorganize thinking; recenter it

# Classifying Threats

- Staffing-related
- Patient-related
- Technology-related
- System-related
- Environment-related
- Patient-Tech
- Tech-System

# Threats

# Threats

53% Threats  
involve technology

**STRATEGIES**

# Strategies

- A plan or method for achieving a goal
- Cockpit Task management
- Workload management
- Aviate-Navigate-Communicate
  - Airway-Breathing-Circulation
- SOPs

# Example Interviewed Threats

- Staff (3): Inadequate support staff
- Patient (5): Inadequate sedation
- Pat-Tech (2): ET tube dislodged
- Tech (5): Ventilator malfunction
- Tech-Sys (1): Ambu bag missing
- System (6): No patient history
- Environment (1): Overstimulation from family

		Strategy Actions									
		Check for bag in morning	Start CPR	Press code button	Go to Omni Cell to get bag & mask	Leave the kid to go get a bag	Get RT to work on ventilator while you get bag	Yell for someone to get a bag	Yell to a coworker that you need help	Get a nurse to get a therapist	A RT would come see what the problem is
Strategy Actions	Check for bag in morning	X									
	Start CPR		X								
	Press code button			X							
	Go to Omni Cell to get bag & mask				X	X	X	/			
	Leave the kid to go get a bag				X	X	X	/			
	Get RT to work on ventilator while you get bag				X	X	X	/			
	Yell for someone to get a bag				/	/	/	X	\		
	Yell to a coworker that you need help							\	X	/	/
	Get a nurse to get a therapist								/	X	X
	A RT would come see what the problem is								/	X	X

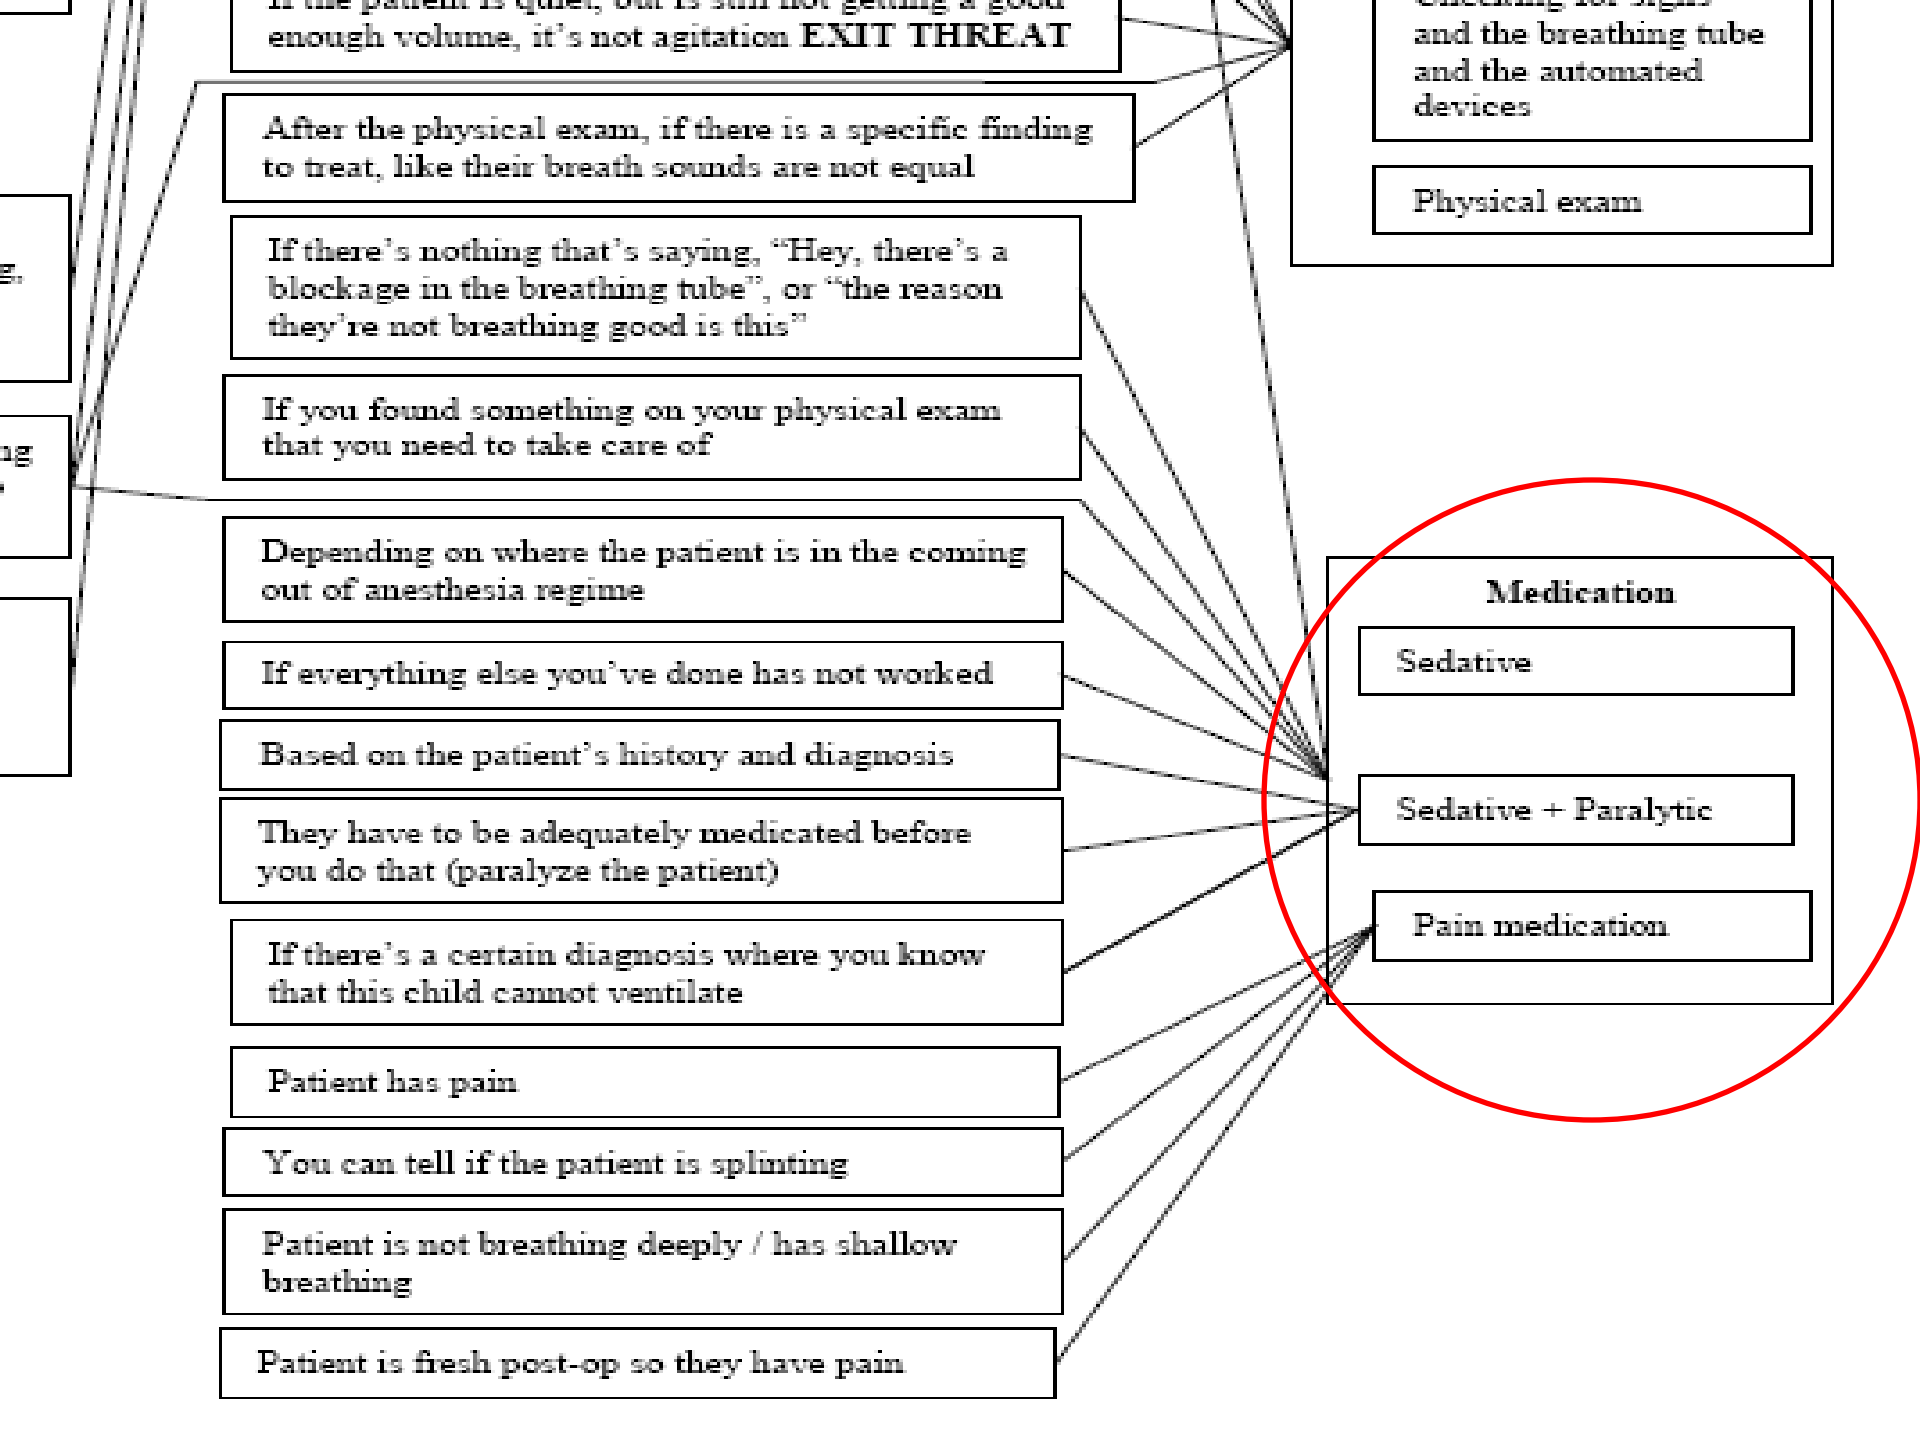

**Locate bag at the start of the shift**

**Perform CPR**

**Call a code**

**Get an AMBU bag**  
 - Get the bag yourself  
 - Get a coworker to get the bag

**Yell for help**  
 - Yell for a coworker  
 - Yell for a respiratory therapist (RT)

If the patient is quiet, but is still not getting a good enough volume, it's not agitation **EXIT THREAT**

After the physical exam, if there is a specific finding to treat, like their breath sounds are not equal

If there's nothing that's saying, "Hey, there's a blockage in the breathing tube", or "the reason they're not breathing good is this"

If you found something on your physical exam that you need to take care of

Depending on where the patient is in the coming out of anesthesia regime

If everything else you've done has not worked

Based on the patient's history and diagnosis

They have to be adequately medicated before you do that (paralyze the patient)

If there's a certain diagnosis where you know that this child cannot ventilate

Patient has pain

You can tell if the patient is splinting

Patient is not breathing deeply / has shallow breathing

Patient is fresh post-op so they have pain

Checking for signs and the breathing tube and the automated devices

Physical exam

**Medication**

Sedative

Sedative + Paralytic

Pain medication

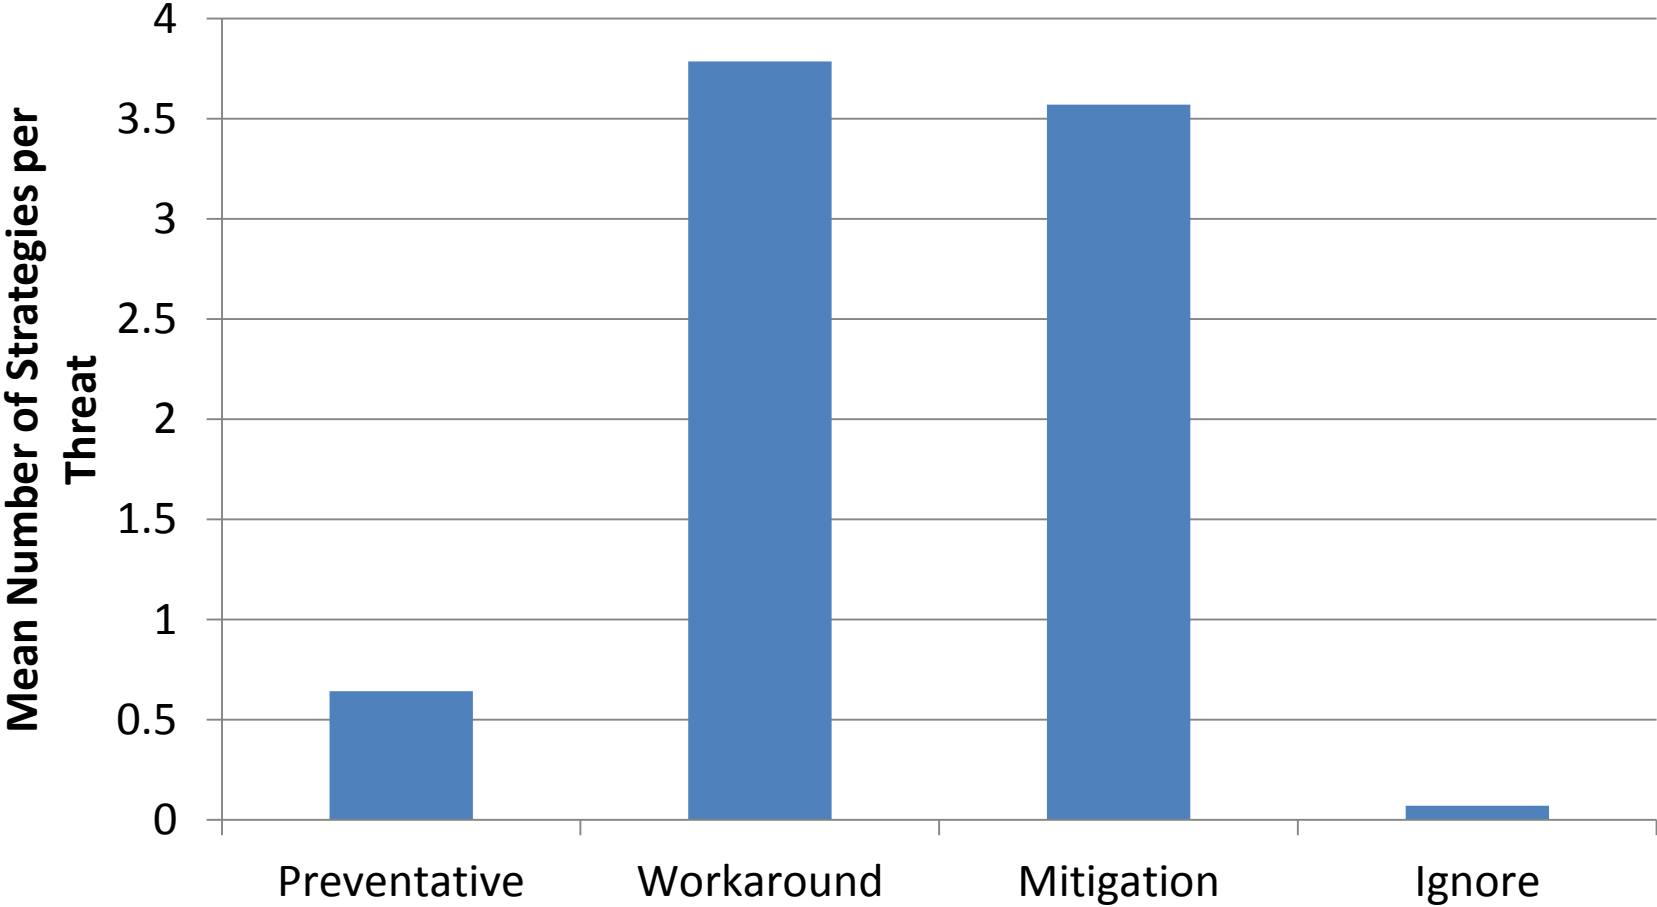

# Strategies per Threat

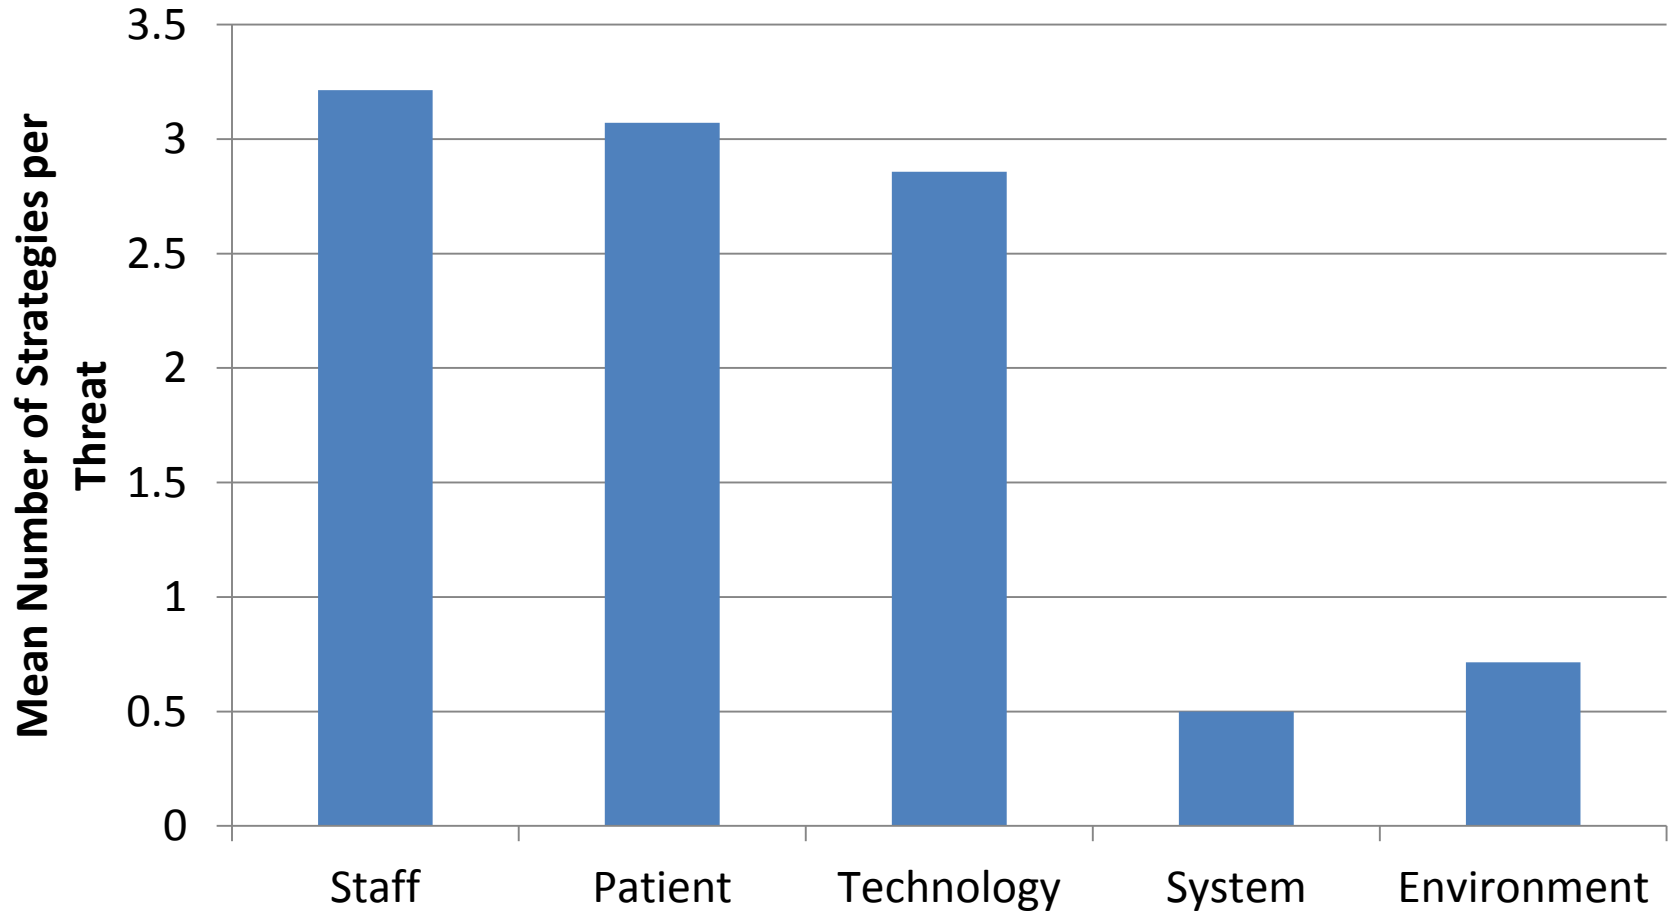

# General Strategy Classification

- Preventative strategies—before the threat
- Mitigating strategies—deal directly with the threat
- Ignore threat—continues as if there is no threat
- Work around strategies—not aimed at threat, but takes the threat into account

# General Strategy Classification

# ICU Strategy Classification

# **MAPPING STRATEGIES TO THREATS**

# General Strategy per Threat

	Strategies			
	Prevent	Work around	Mitigate	Ignore
Inadequate support staff	1	2.5	9	0
Inadequate sedation	0.5	3	4.5	0
ET tube dislodged	0	4.5	2.5	0
Ventilator failure	0	4	2	0
Ambu bag missing	2	2	2	0
No patient history	0	8	1	0
Overstimulation from family	1	2.5	4	0.5

# General Strategy per Threat

	Strategies			
	Prevent	Work around	Mitigate	Ignore

# Nurse's Bag of Strategies

- Threats were often dealt with by a variety of strategies; staff, patient, technology strategies were common
- Strategies for managing the system were rare
- Strategies usually managed same resources as those that characterized the threat
- Many strategies dealt directly with the threat
- Nurses “worked around”

Tech & System threats

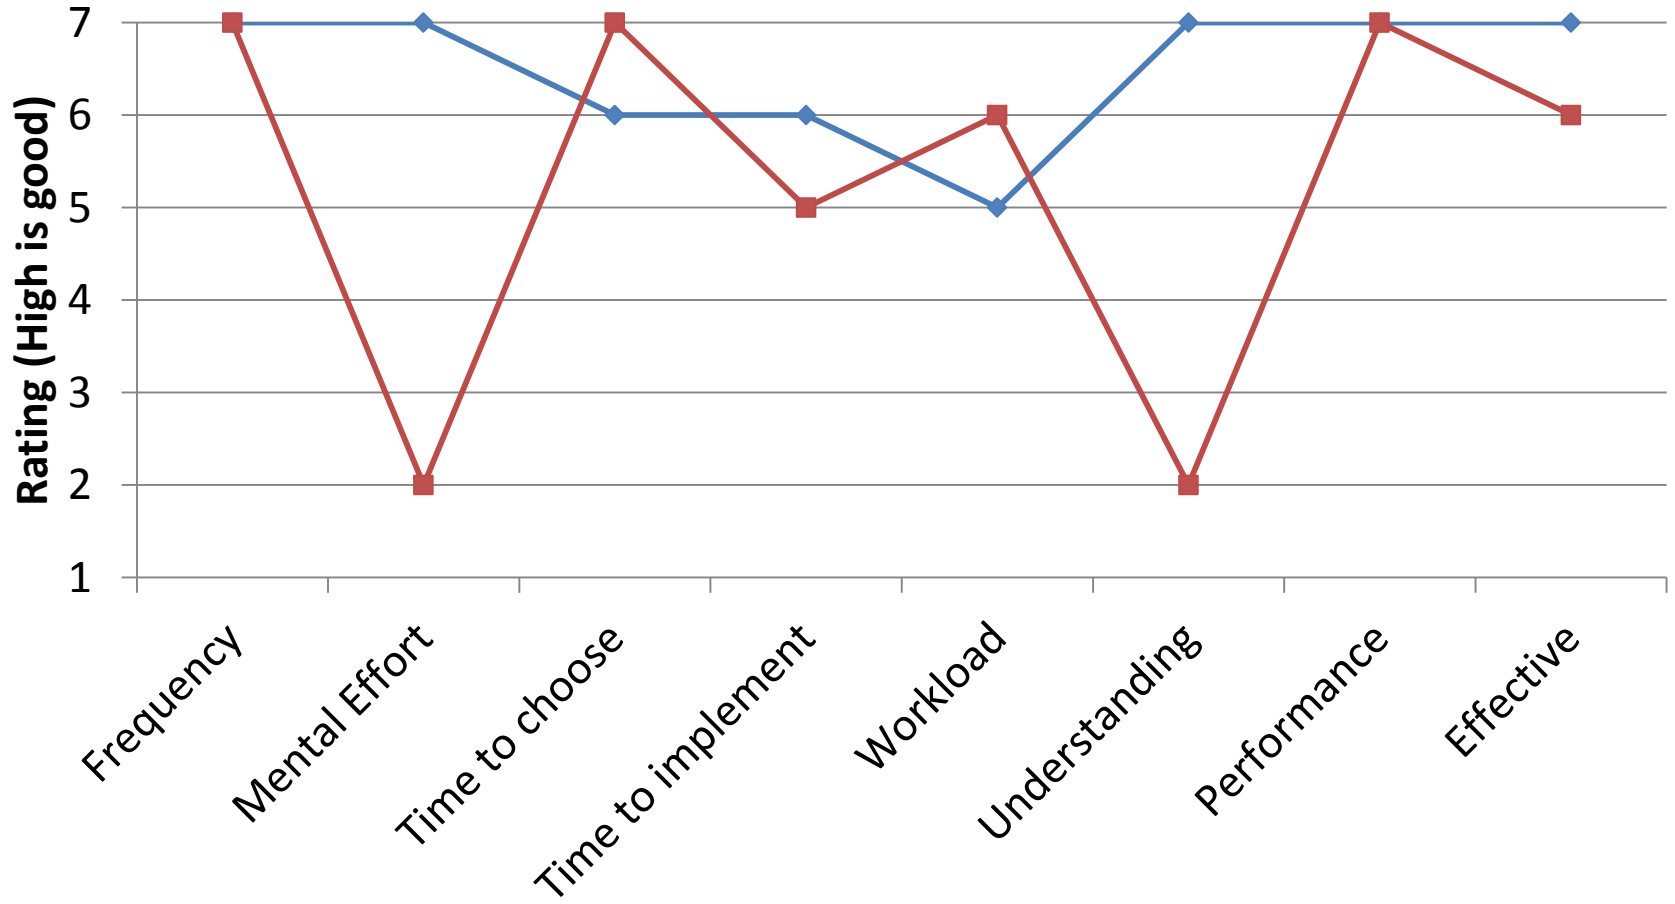

# **EVALUATING STRATEGIC ARSENALS**

# Evaluating Arsenal's

# Evaluating Arsenal

# Arsenals

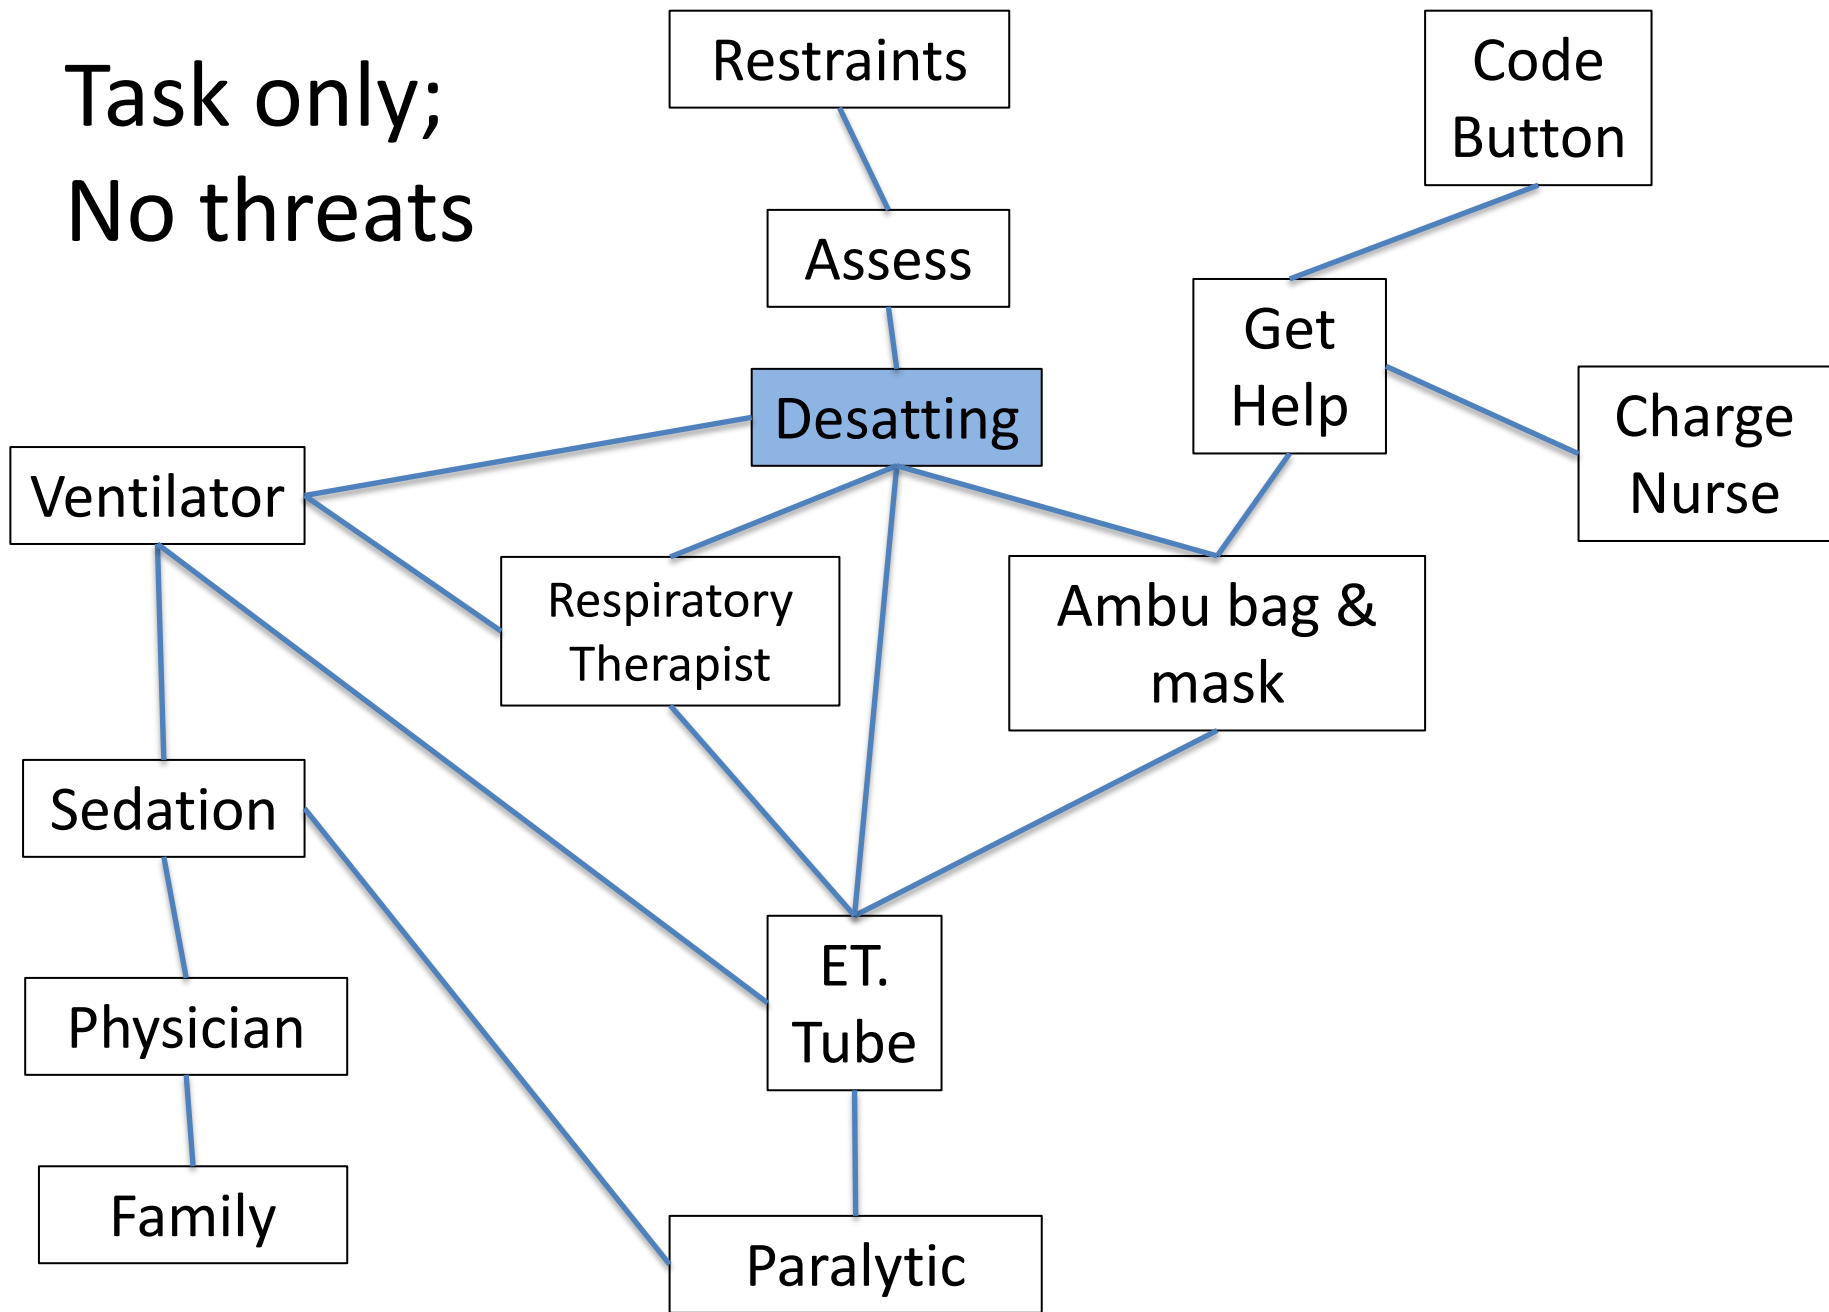

Threat	Type	Mean of all strategies	Mean of best strategies
Paired-patient	Staffing	6.1	6.5
Ventilator malfunction	Technology	5.0	6.0
Ambu bag missing	Tech-System	4.9	5.3
Inadequate sedation	Patient	4.1	5.5
Patient agitation	Patient	4.0	4.0
ET tube dislodged	Tech-Pat	3.8	5.0
Inadequate support staff	Staffing	2.9	5.4
Overstimulation from family	Environment	2.0	4.0
Physician unavailable	Staffing	1.5	3.3

A Gap in the Strategic Arsenal?

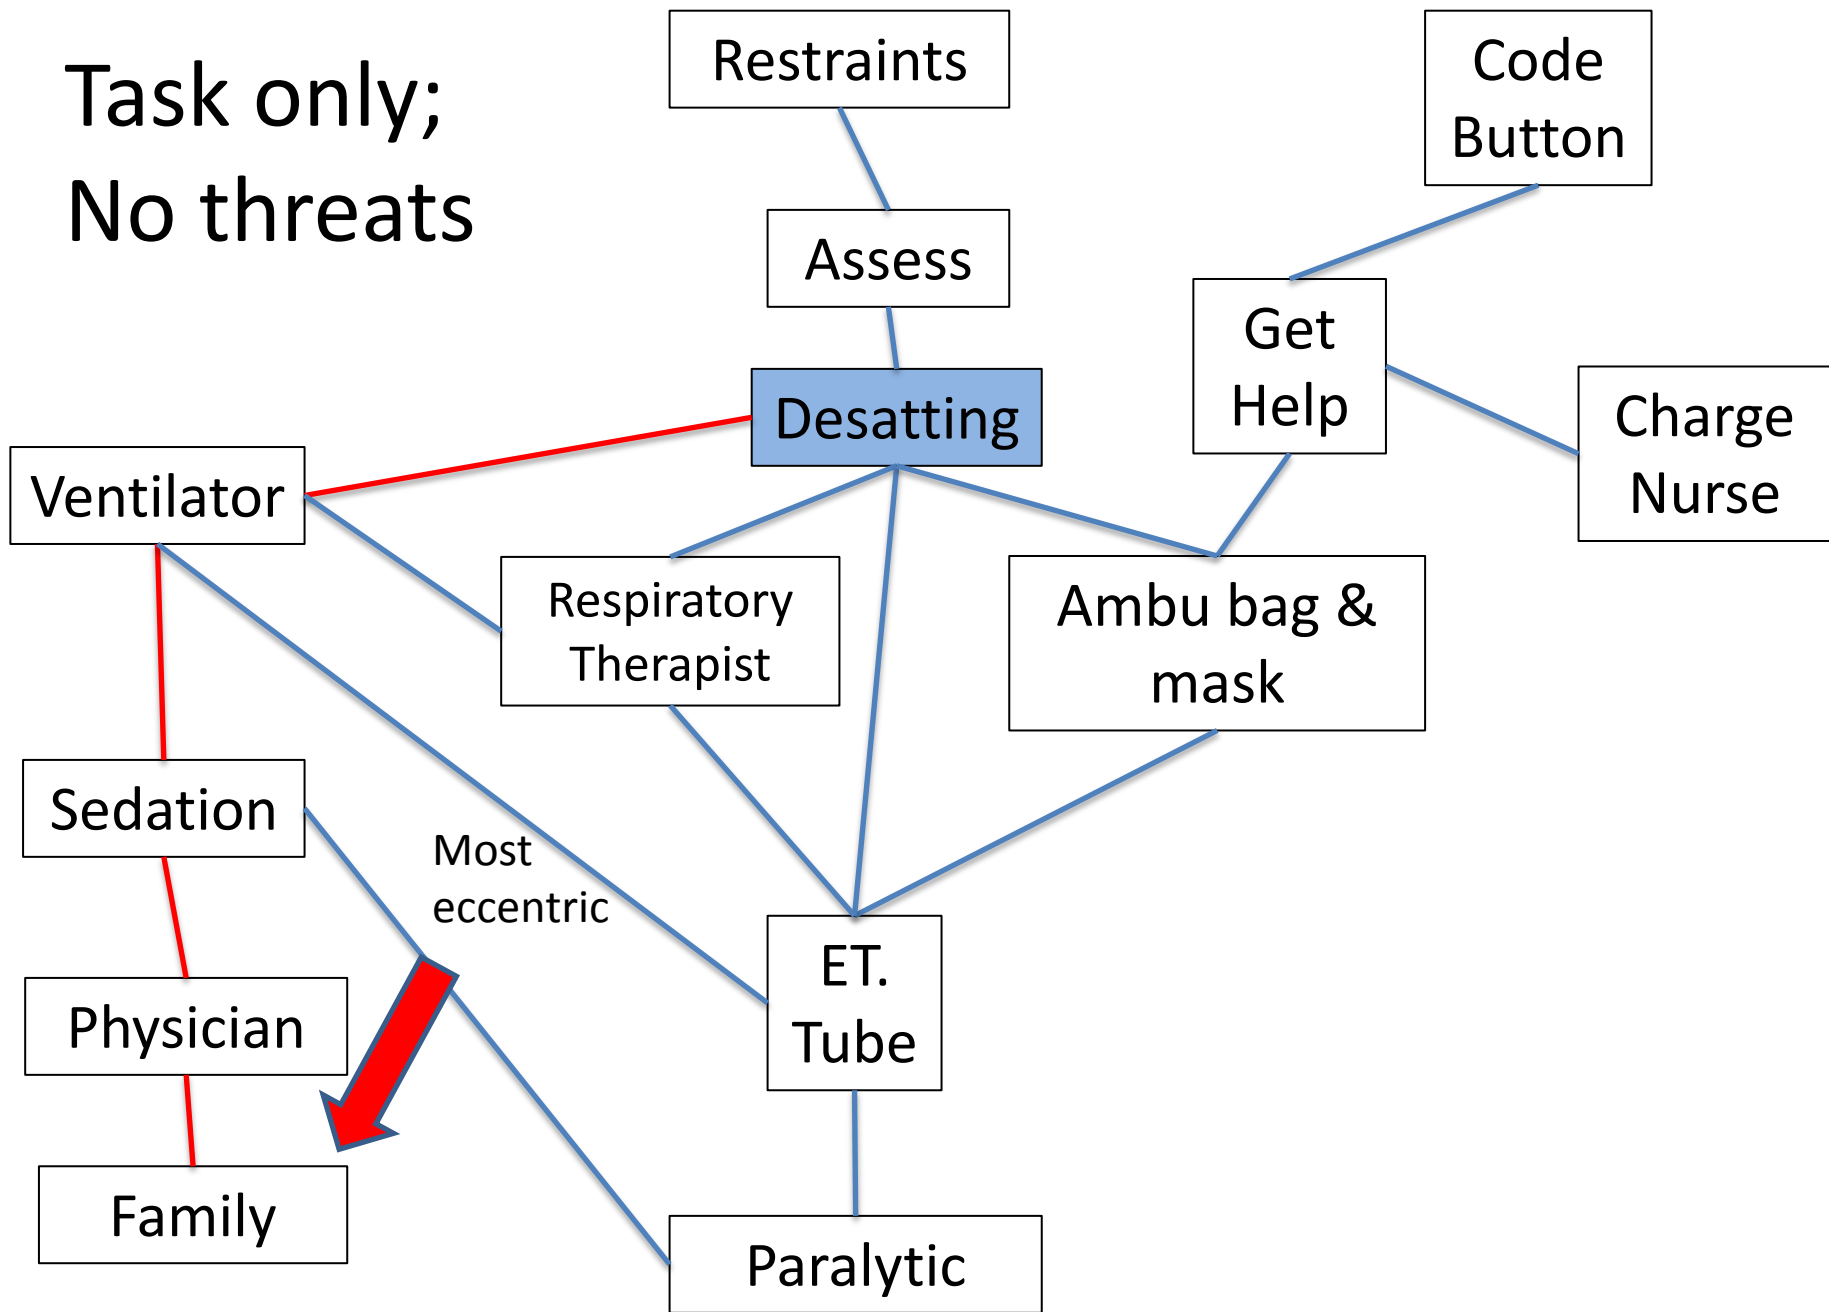

# **OVERSTIMULATION FROM FAMILY**

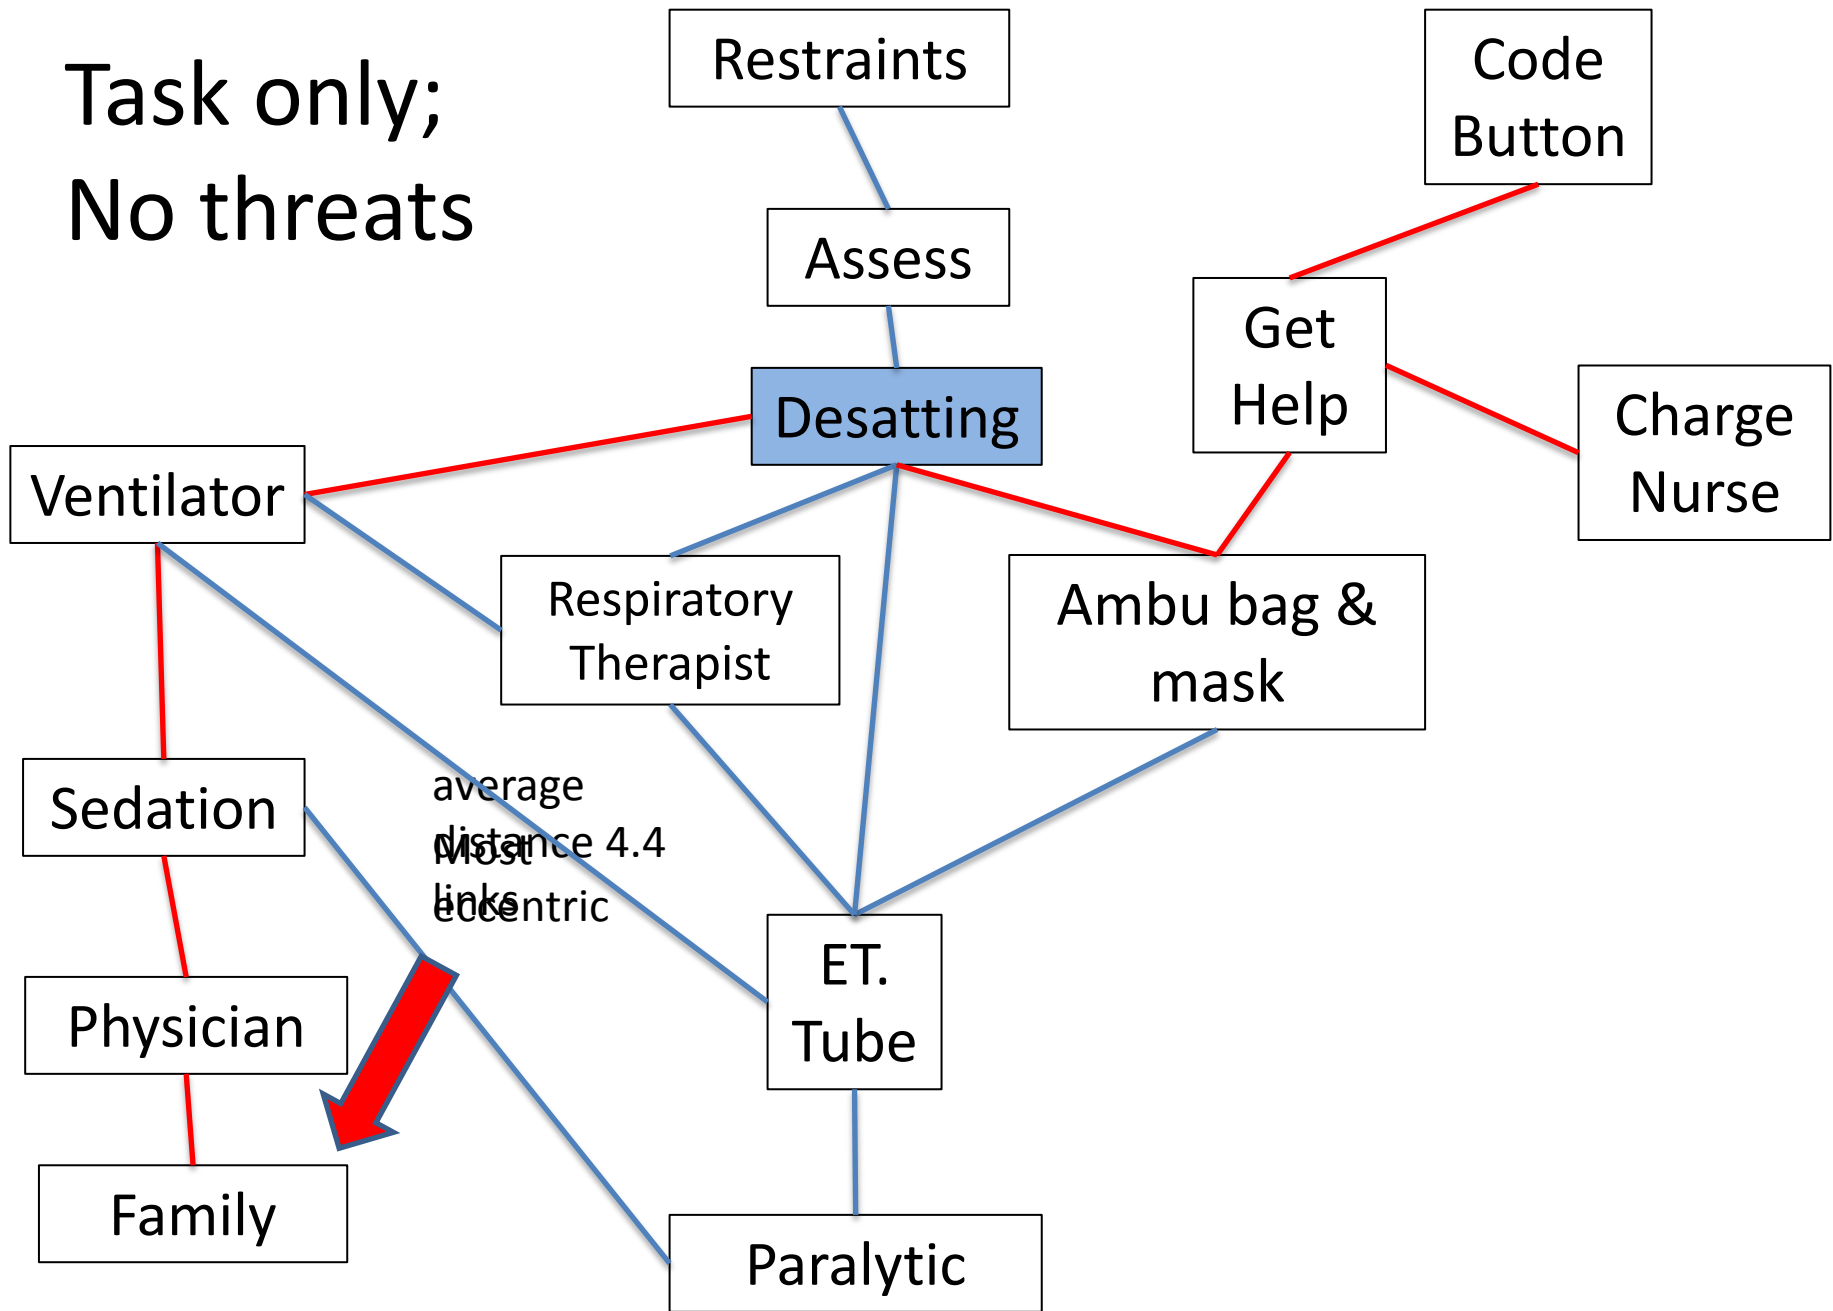

Task only;  
No threats

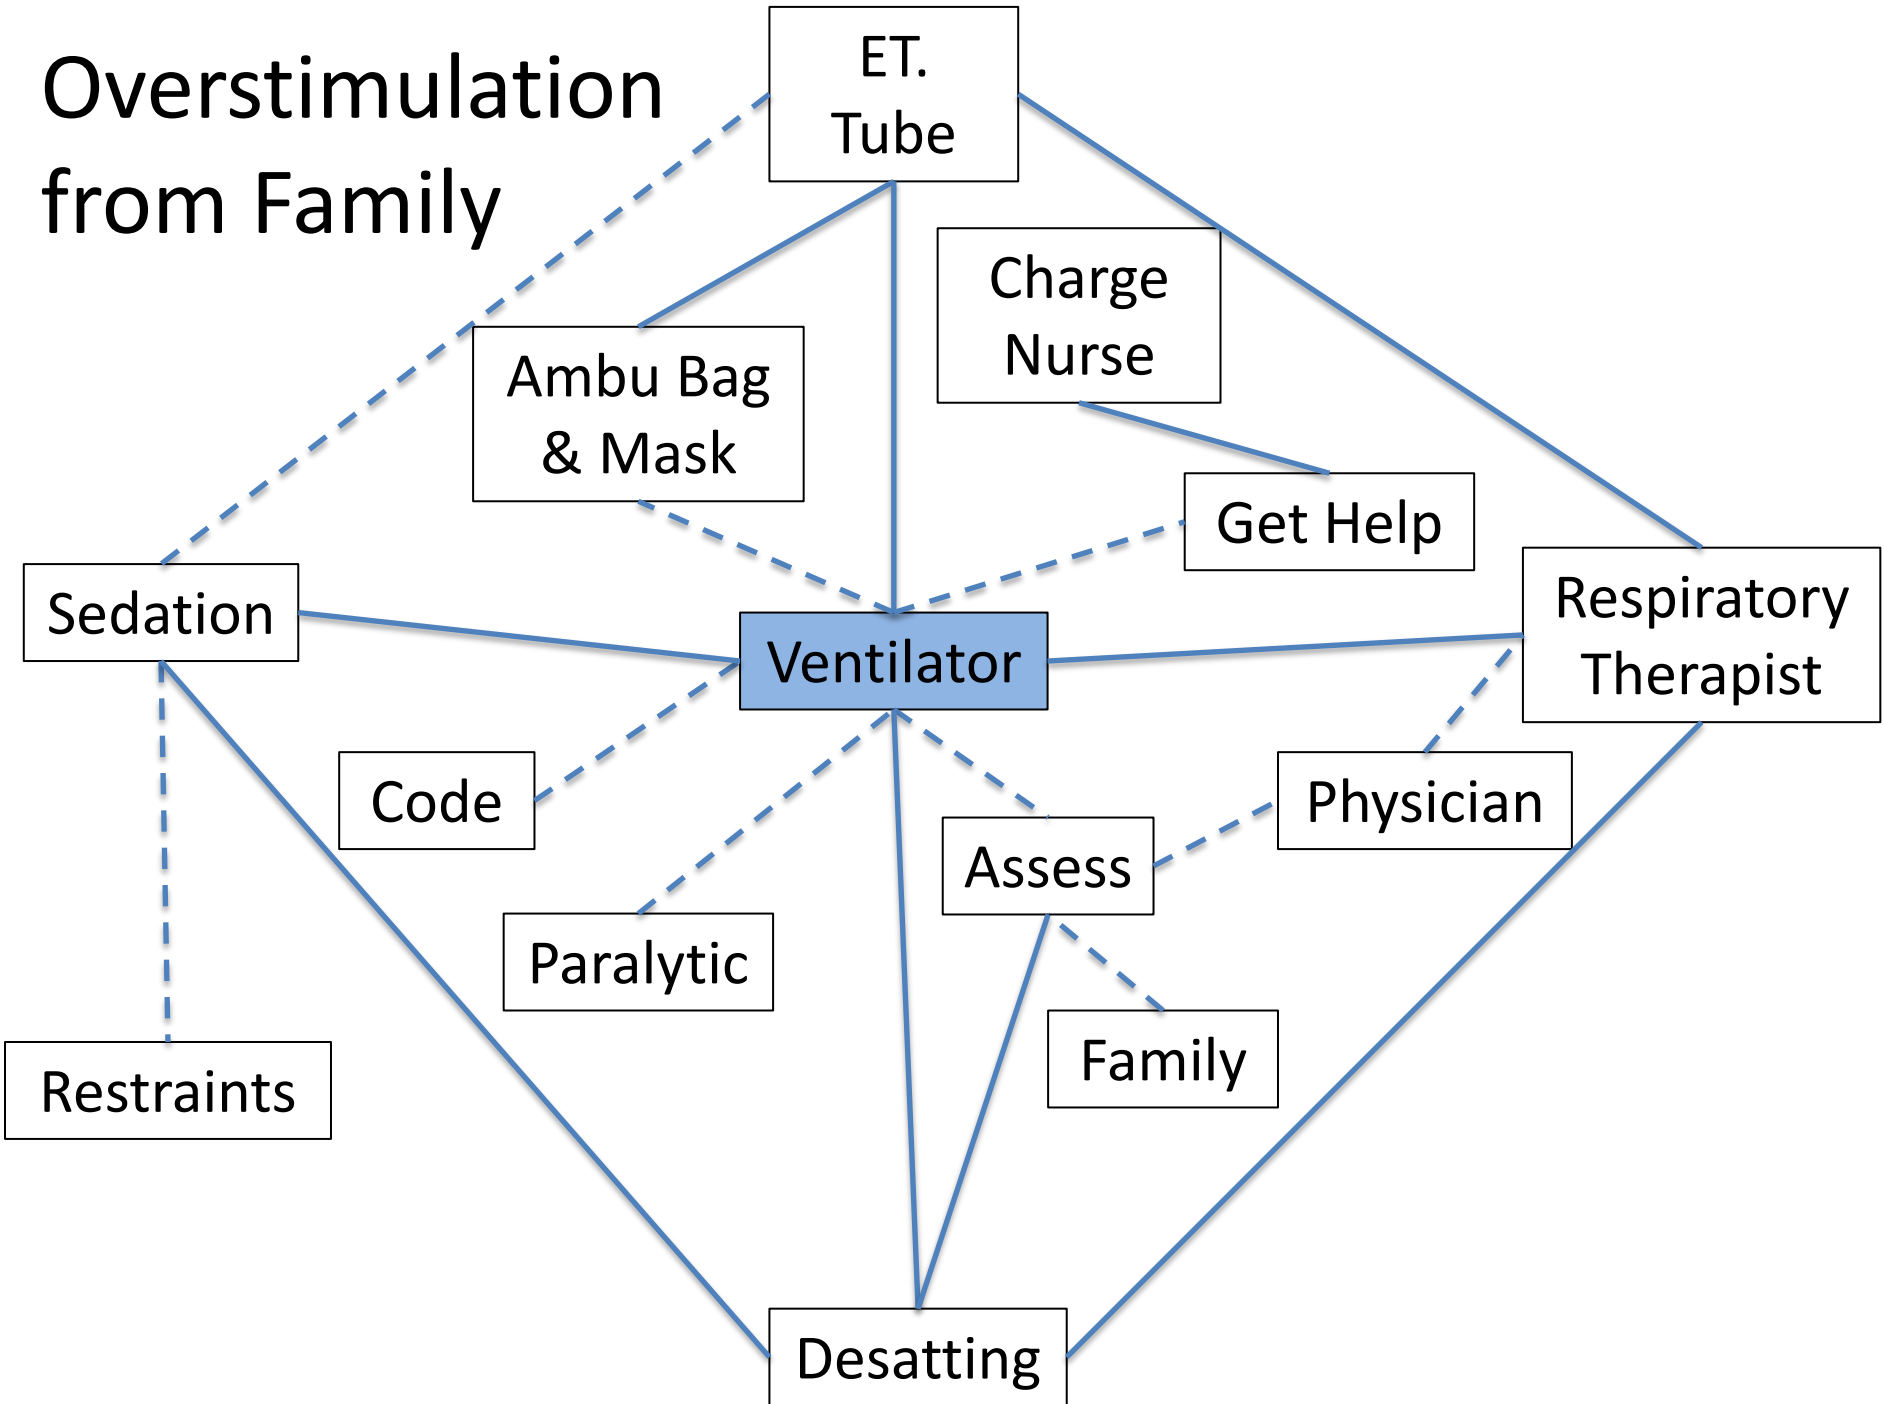

Task only;  
No threats

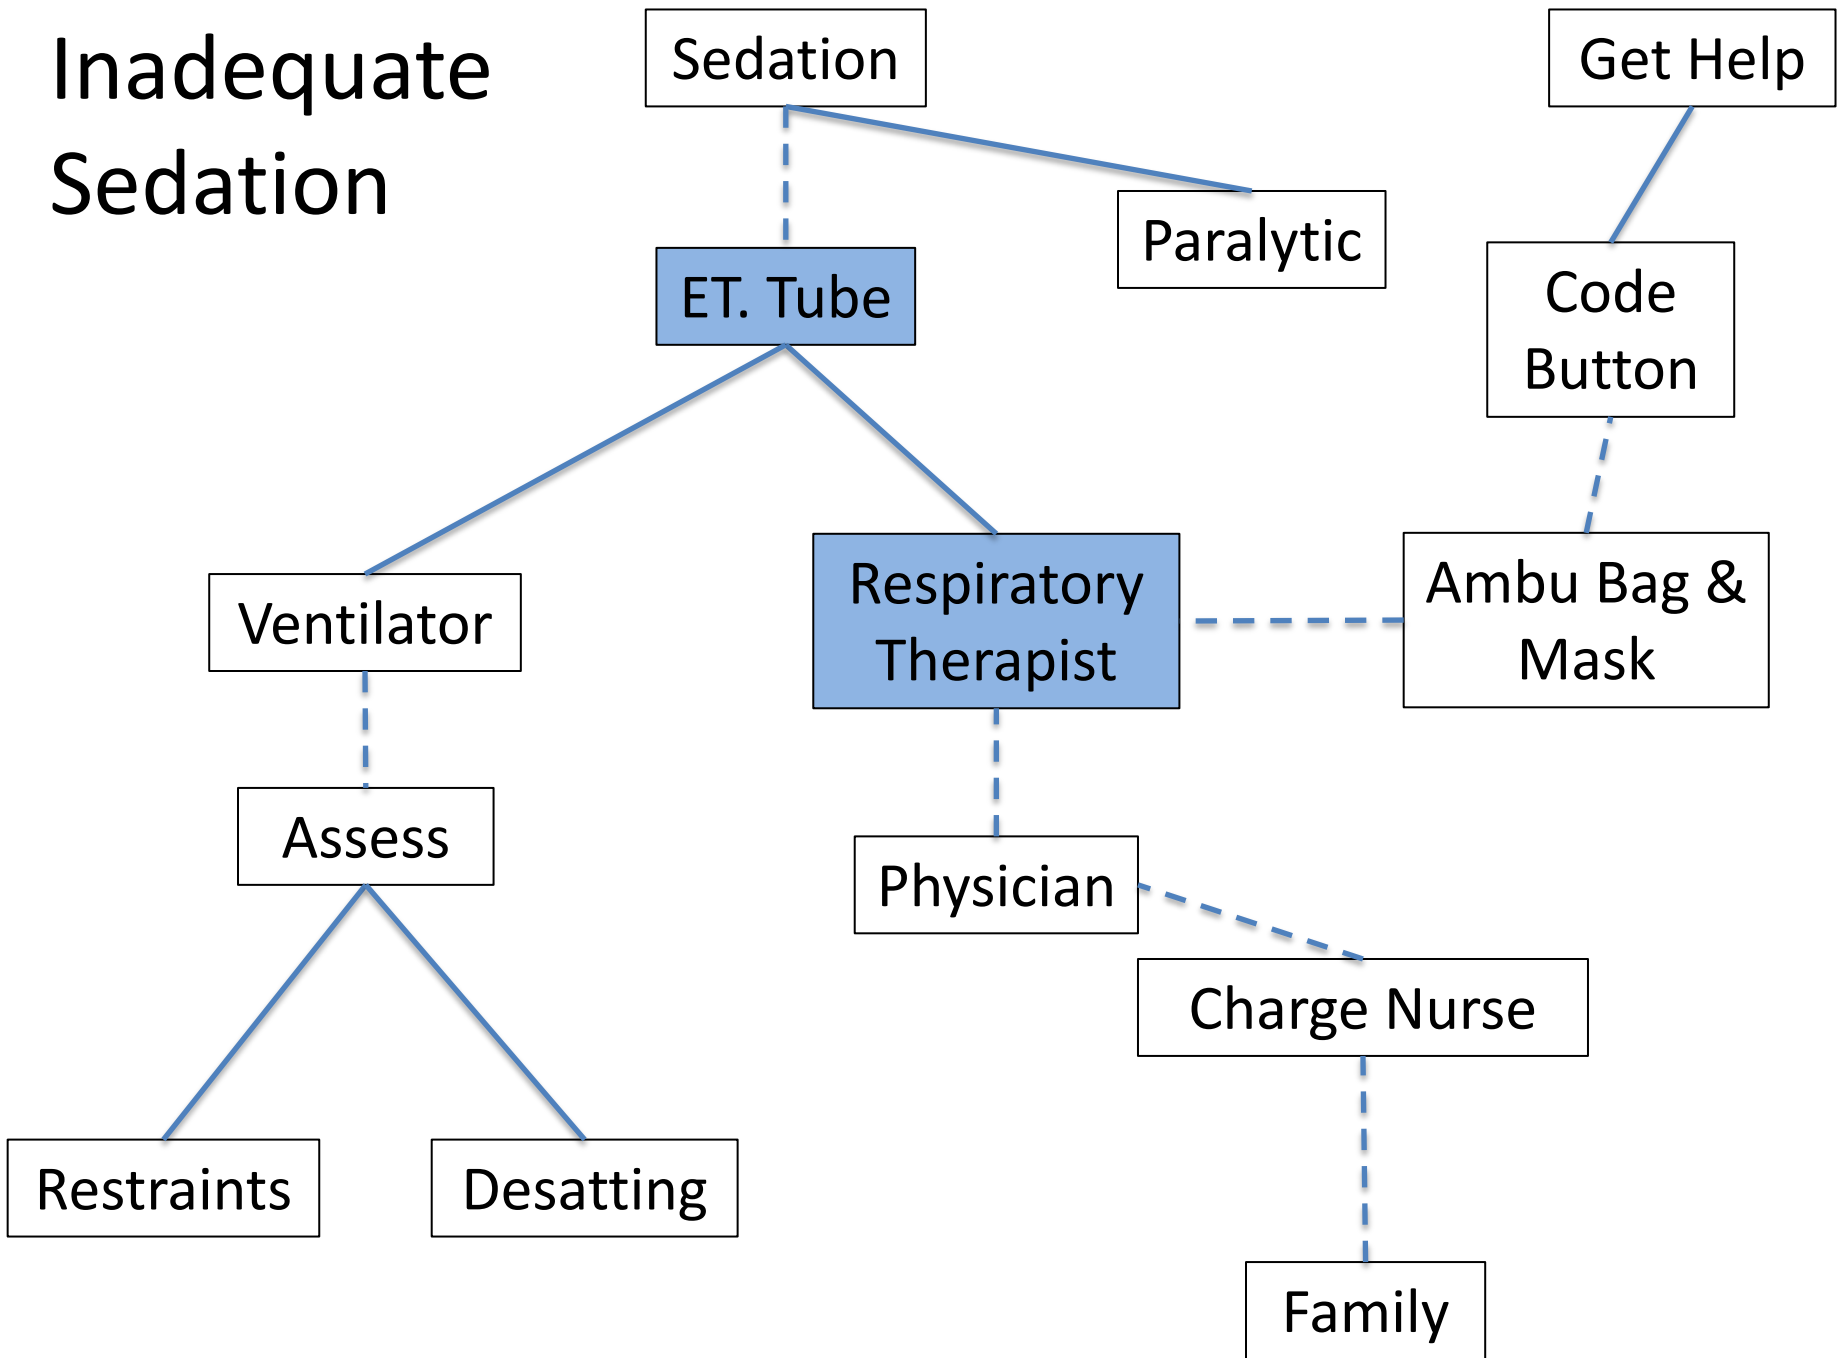

Task only;  
No threats

# Overstimulation from Family

# Inadequate Sedation

# The *Family* Concept

## Overstimulation from family

- FAMILY now part of the graph
  - 2 links from median
  - 2.8 on average
  - 4 max (charge nurse, restraints)

## Inadequate sedation

- FAMILY again eccentric
  - 4 links from median
  - 4.7 links on average
  - 7 max (diameter w/desatting & restraints)

$$r = -.12$$

# Overstimulation from Family

- 60 strategies across 10 expert PICU nurses

# Overstimulation from Family

**Call a physician**

**Sedation**

**Let parents assist in  
patient care**

**Use your colleagues to  
back you up**

**Communicate with the  
family**  
- Discuss with the family  
- Set goals with the  
family

**Get the respiratory  
therapist (RT) and  
physician**

- 19 ineffective
- 27 were effective but required high effort
- 5 were effective but required moderate effort
- Only 9 both effective and low effort

# Best strategies—Nurse 8

# “Good” strategies

Nurse	Effective & Low work	2 <sup>nd</sup>	3 <sup>rd</sup>
1	None		
2	Partnership (3)		
3	Explain (5)	Ask not to touch (4)	Ask to sit down (1)
4	None		
5	Get director (5)		
6	Sedate (5)		
7	None		
8	None		
9	None		
10	Assess patient (5)	Get superior (4)	Communicate w/parent (3)

- Only 5 nurses had any “good” strategy
- Only 2 nurses had more than 1 “good” strategy
- Experience and quality of strategy were uncorrelated ( $r = .03$ )

**TAKE HOME**

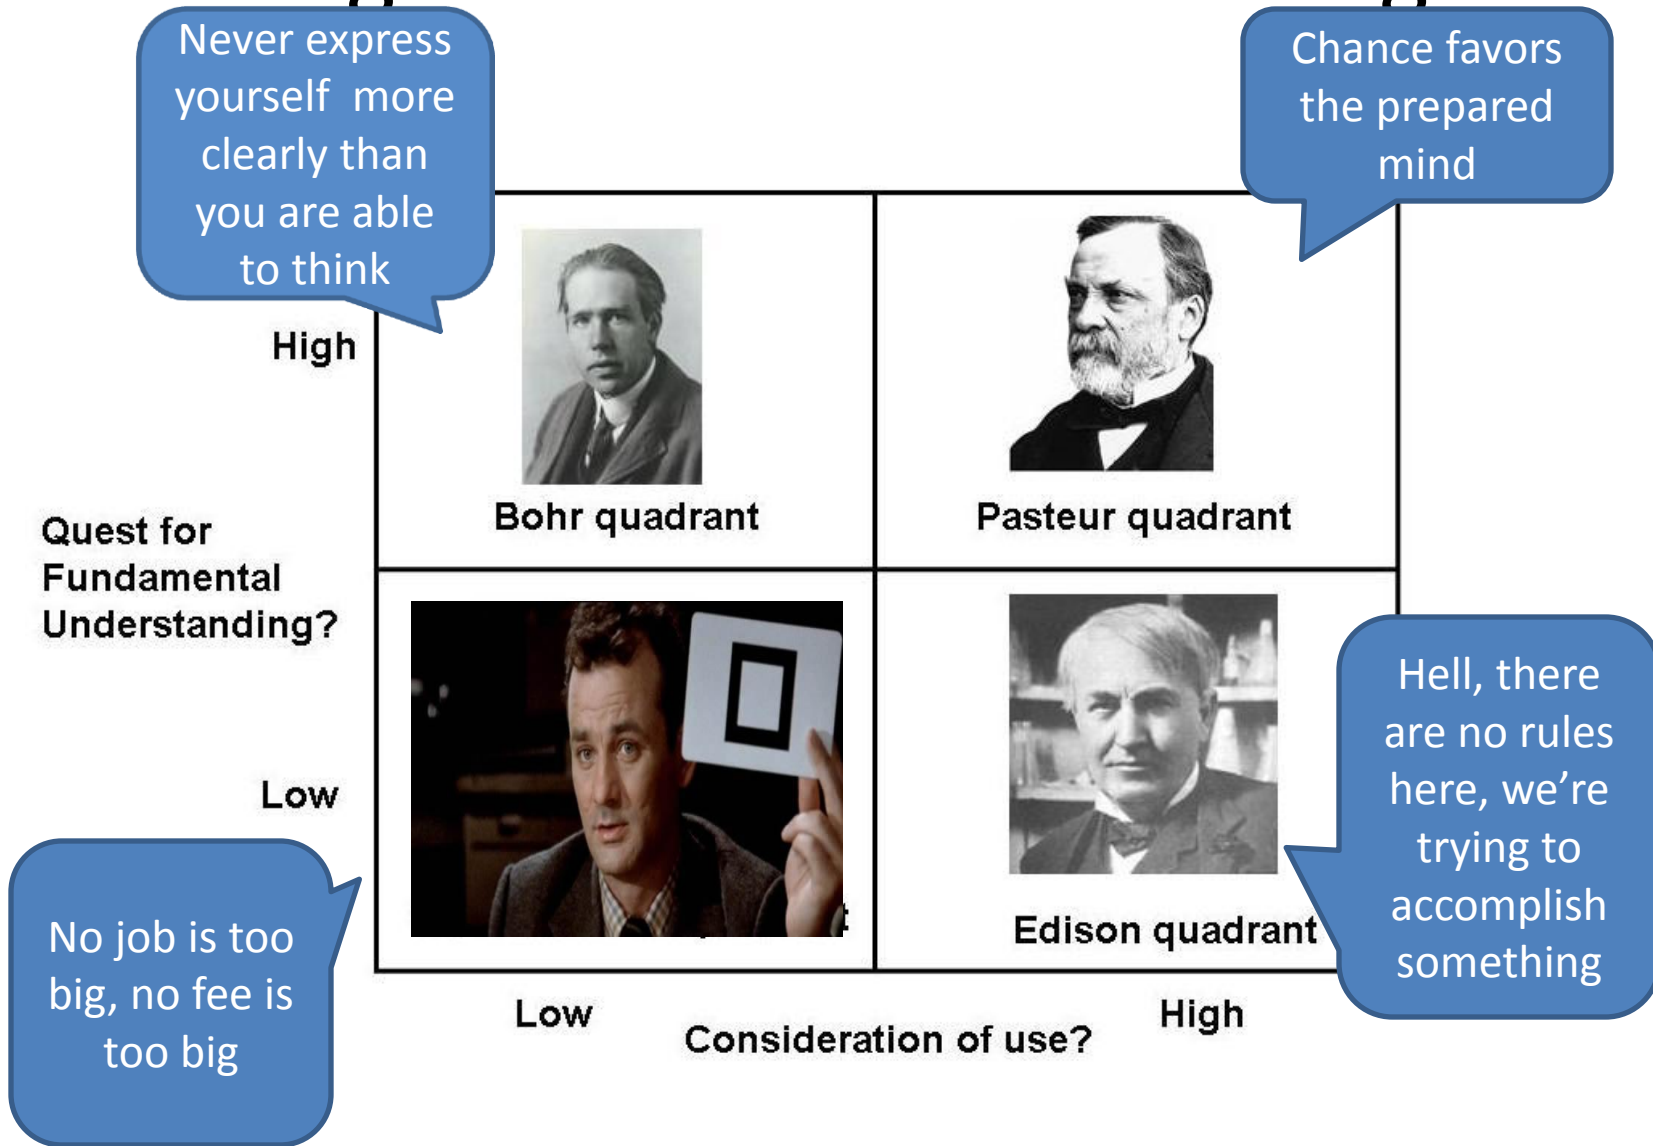

# Take home messages

- Nurses manage threats:
  - Threats change the nurses cognitive landscape
- By processing patient oriented, perceptual and memorial cues to . . .
- Select strategies
  - To remove the threat or to
  - Work around system & technology threats

# How good are these strategies?

- Nurses are resilient!
- Sometimes forced to choose between quick but ineffective strategies and effective but intensely effortful strategies
- For some nurses, for some threats, like Overstimulation from Family, there are too few good strategies
- Solutions may be in nontechnical training

# More insightful take home messages

"I was just rubbing sticks  
together for fun — I didn't  
realize I was doing  
basic research."

Thank you

# Pasteur in his quadrant

- **Basic:** tartaric vs. paratartaric acid
  - all *organic* crystals rotate light
- **Applied:** Contamination in fermentation
  - Crystals rotate light → fermentation was organic (Germ theory)
- **Basic:** Germ theory → experiments
  - Swan necks & beef broth
- **Applied:** beer, wine, silkworms, pasteurization, antiseptics
- **Basic (Analogy):** Fermentation::contagious disease
- **Applied:** Vaccinations

# Strategy Profiles

- Assessment of strategy on:
  - Frequency of use
  - Mental effort
  - Time to choose
  - Time to Implement
  - Workload
  - Situation Awareness
  - Performance
  - Effectiveness

# Evaluating strategy profiles

# How often & how effective?

- Effectiveness & Frequency of use are uncorrelated (.05)
- Workload/effort → frequency
- SA & Performance → Effectiveness

# Hospitals

- 5,754 hospitals (941,995 beds; 37M admissions; \$751B)
  - 2904 not for profit nongovernment
  - 1013 for profit
  - 1068 state and local government

# Nursing

- 5 million nurses and support staff
- 2.5 million RNs
  - 503,000 critical care
  - 230,000 in xICU
- Supply 35% of patient's direct care
- 25%-30% of the nurses' time on direct care
- 45 years old; 20% turnover rate projected
- 1-2 high acuity patients (4-6 patients)

# ATC strategies

- Derived from ATC-based taxonomies (Durso & Alexander, 2010; Koros, Della Rocco, Panjwani, Ingurgio, & D'Arcy, 2006; Loft, Sanderson, Neal, & Mooij, 2007)
  - Planning
  - Monitoring
  - Workload management
  - Situation Awareness
  - Coordination
  - Performance enhancement
  - Simplify
  - Precision
  - Problem resolution
  - Information gathering
  - Unclassified

<b>Planning</b>	Risk assessment	Formulating a backup plan	Anticipate pushbacks		
<b>Monitoring</b>	Problem detection	Attend to critical points where problems have occurred/Focus on potential trouble areas			
<b>Workload management</b>	Adding more positions/Decombine	Request a gap in traffic	Anticipate workload peaks		
<b>Explicit SA enhancement/Maintain in SA (Loft)</b>	Actively heighten SA	Actively attempt to get the other guy's SA			
<b>Performance enhancement</b>					
<b>Simplify</b>	Amalgamation		Use heuristics that minimize control		
		Group streams		Take the best	Fast and frugal
<b>Precision</b>	Differentiation	Weight dimensions			
<b>Problem resolution</b>					
<b>Nominal strategies</b>	Resolve problems immediately	Rely on past experience	SOPs		
<b>Off-nominal strategies</b>					
<b>Information gathering</b>	Rely on observations	Rely on pilot reports			
<b>Coordinating</b>	More effective communication	Providing others sufficient information	Ground control prepares	Pay special attention to coordination with other controllers	
<b>Unclassified strategies</b>					
Expedite	Slowing down	Eliminate threat	Mitigate threat	Work around threat	Add more frequencies
Maintain control of frequencies	Prioritize	Get a better view			

# Predicting frequency estimates

- Performance + Time-to-implement =  
Frequency
